How did you get involved with exoplanets and Kepler?

Detecting New Planets in Transiting Systems

Jason Steffen

A dissertation submitted in partial fulfillment of  
the requirements for the degree of

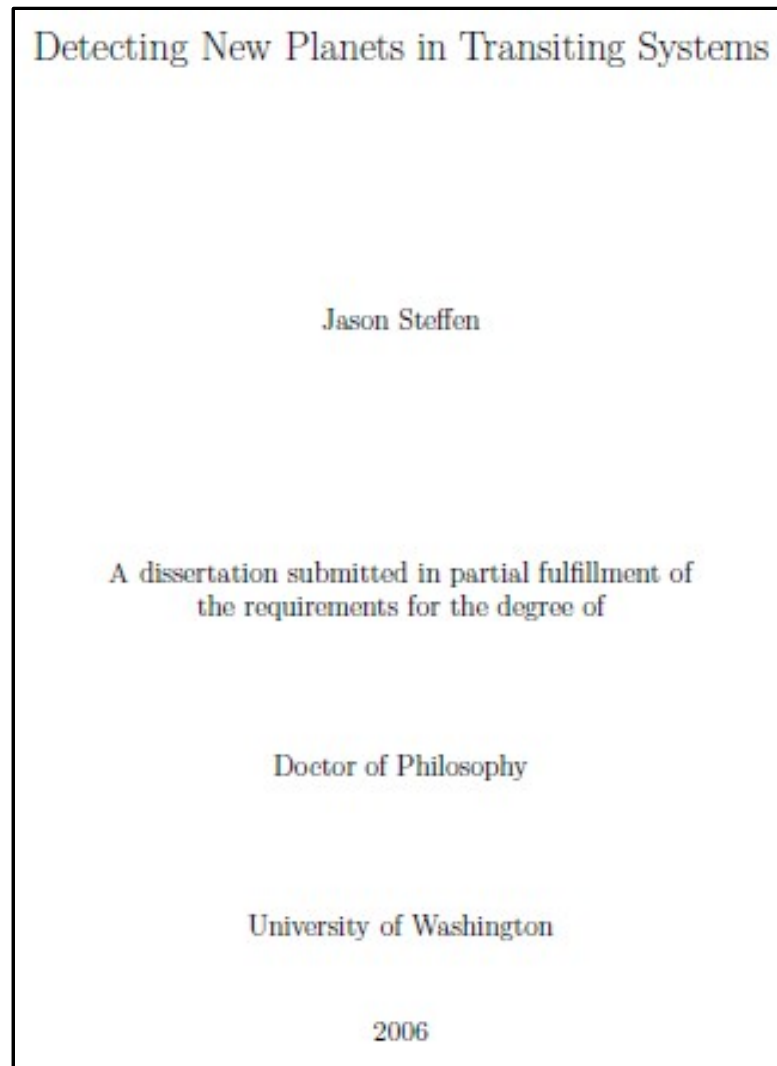

Doctor of Philosophy

University of Washington

2006

# Fermilab Exoplanet Team

How did you get involved with exoplanets and Kepler?

How did you get involved with Fermilab?

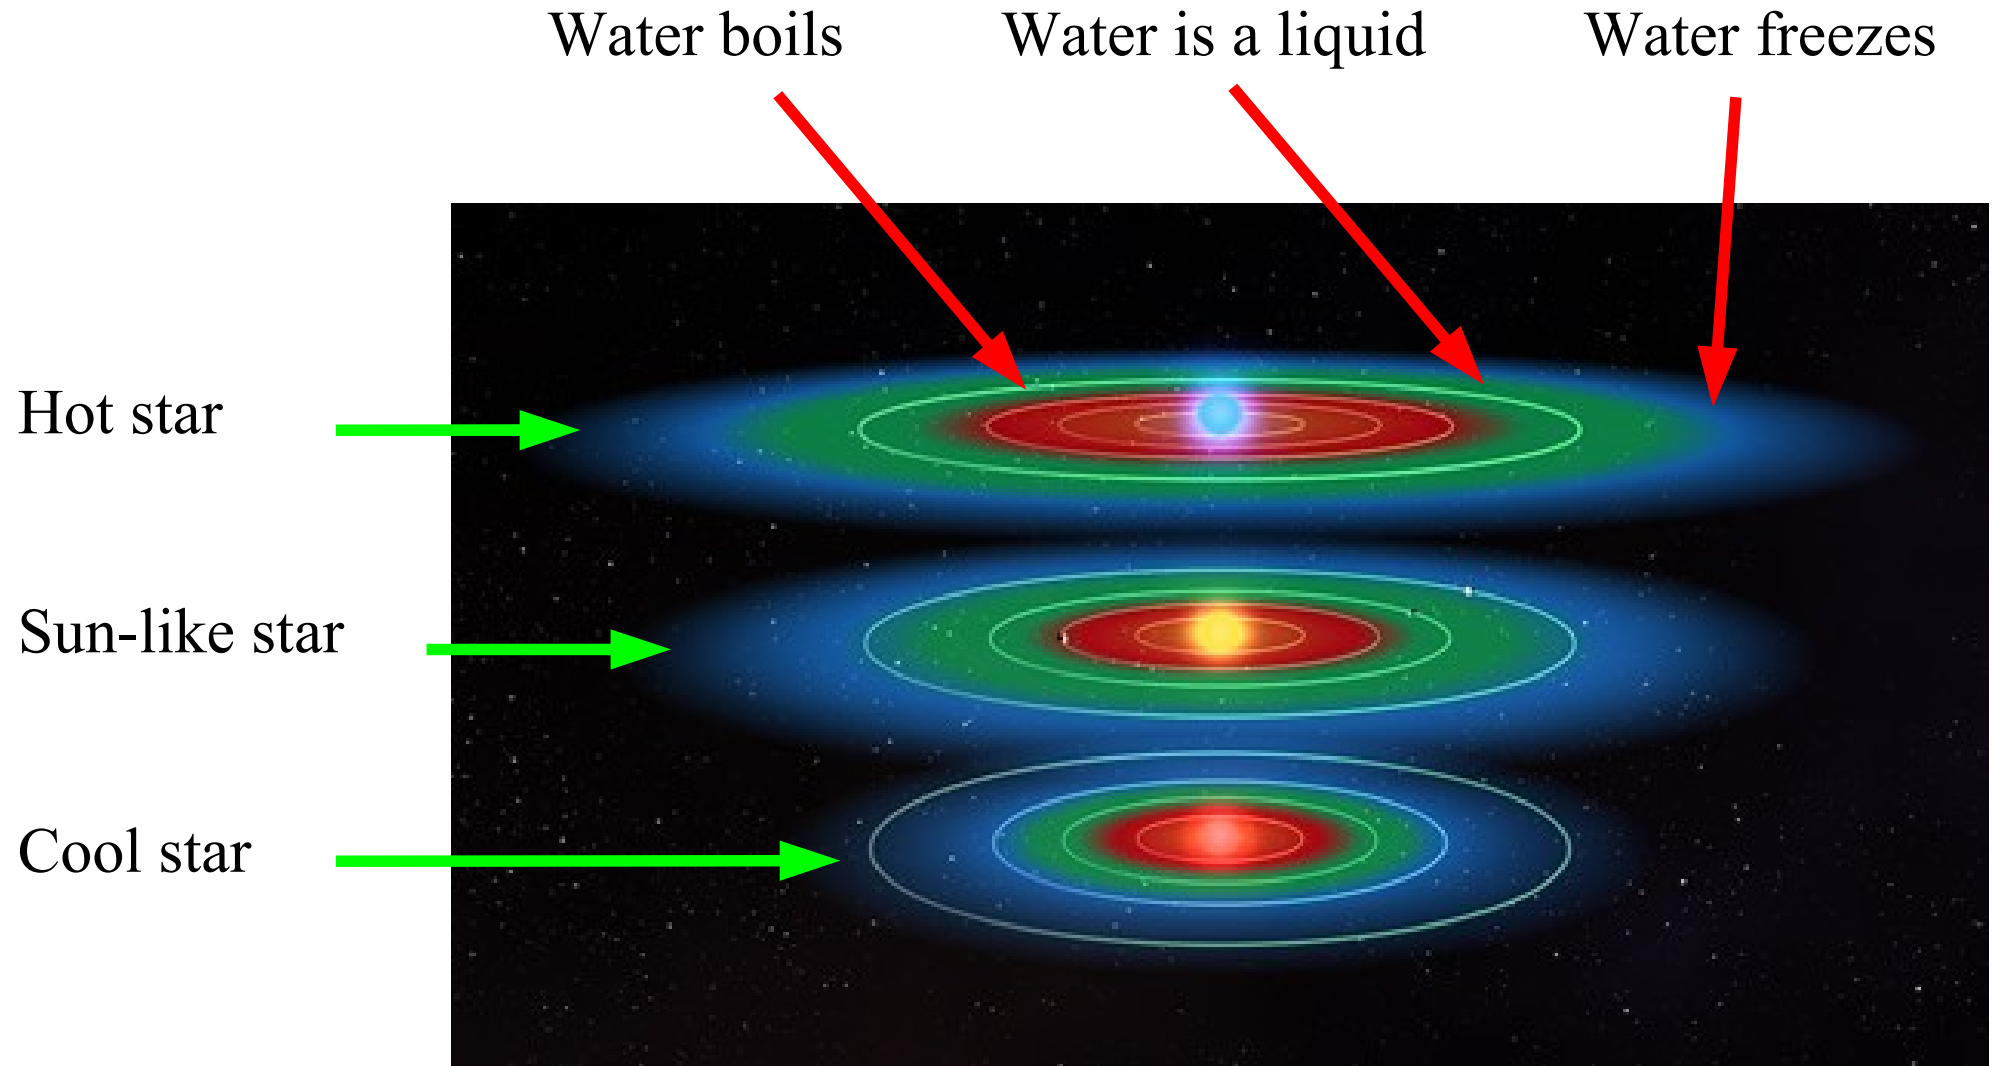

# Talk Overview

- Motivation for the Kepler mission
- Planet Detection Methods
- Mission overview
  - instrument design
  - survey strategy
  - ground-based program
- Launch and flight operations
- First exoplanet discoveries
- Additional Kepler science
- Future of the mission

# Kepler Motivation

# Kepler Motivation

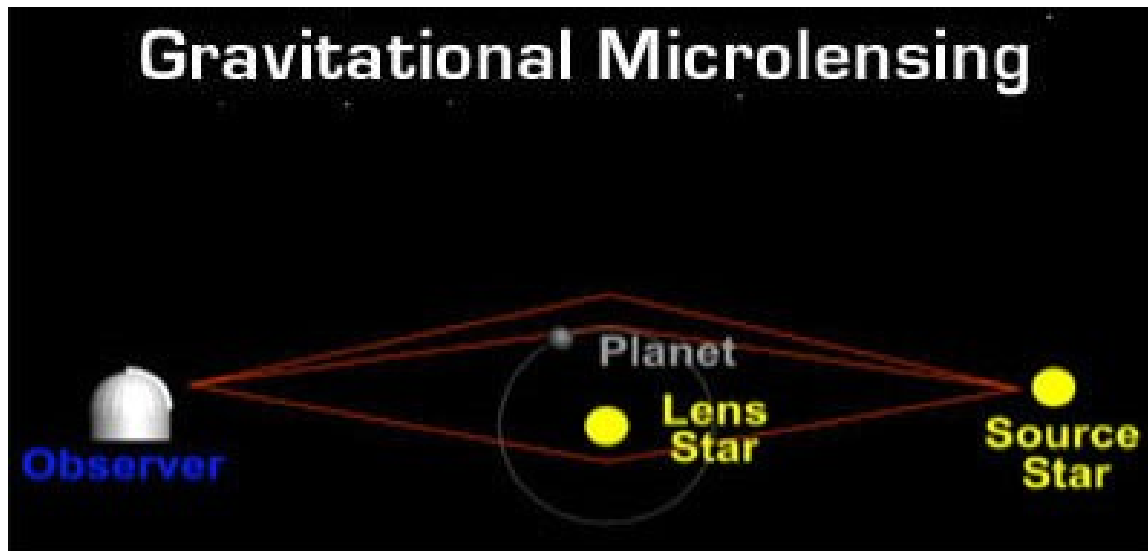

# Planet Finding: Pulse Timing

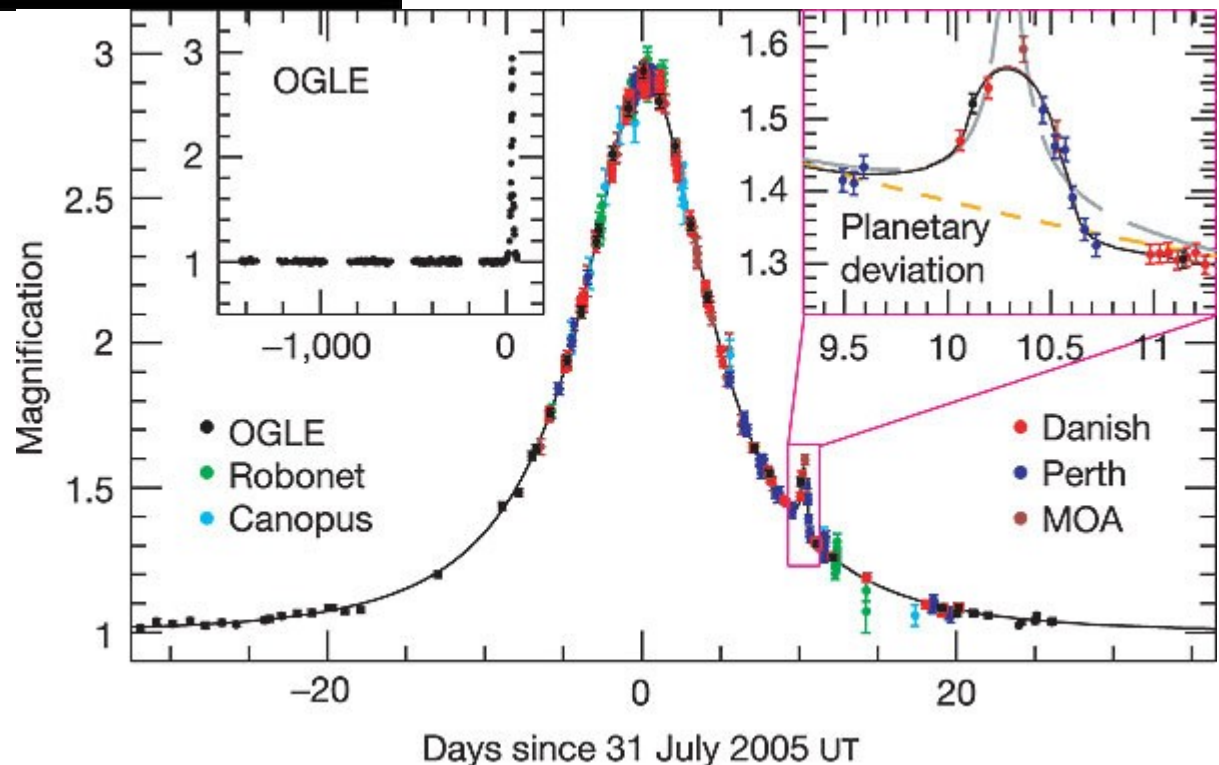

These aren't the planets we're looking for.

# Planet Finding: Gravitational Lensing

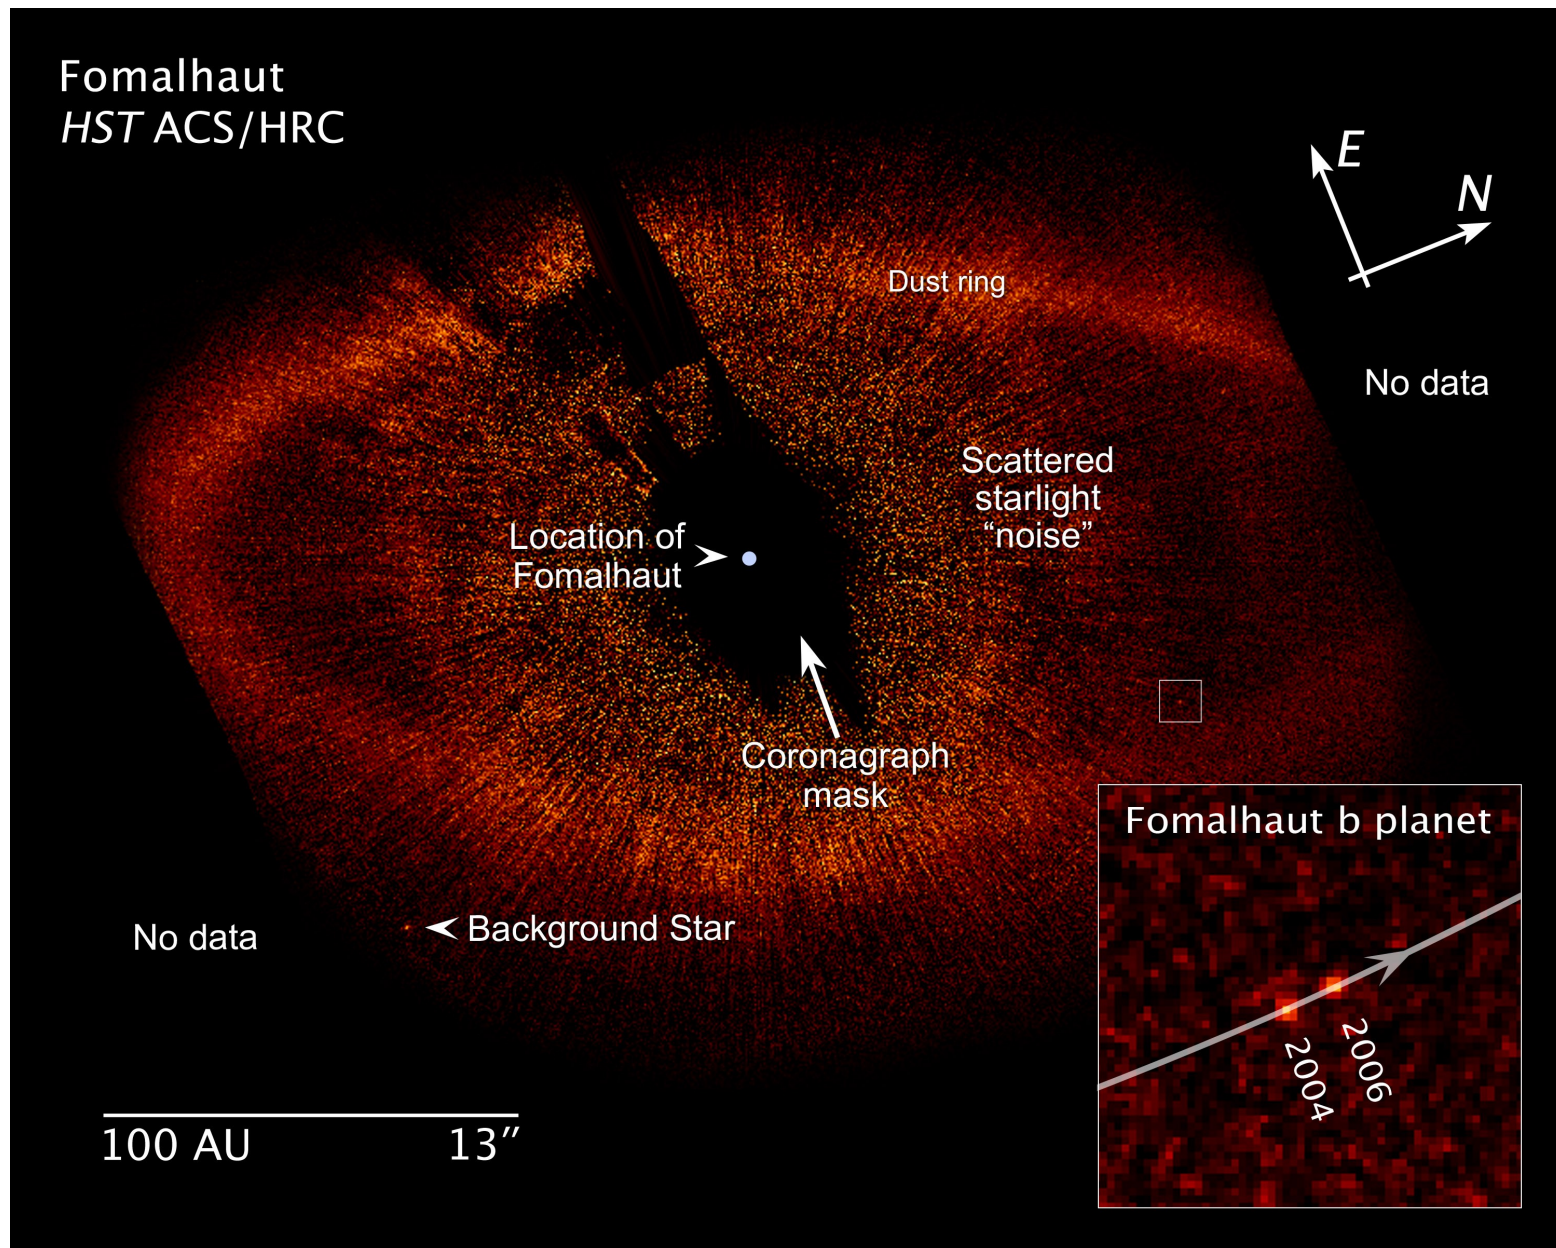

Currently, the only way to get a galaxy-wide census of planets.

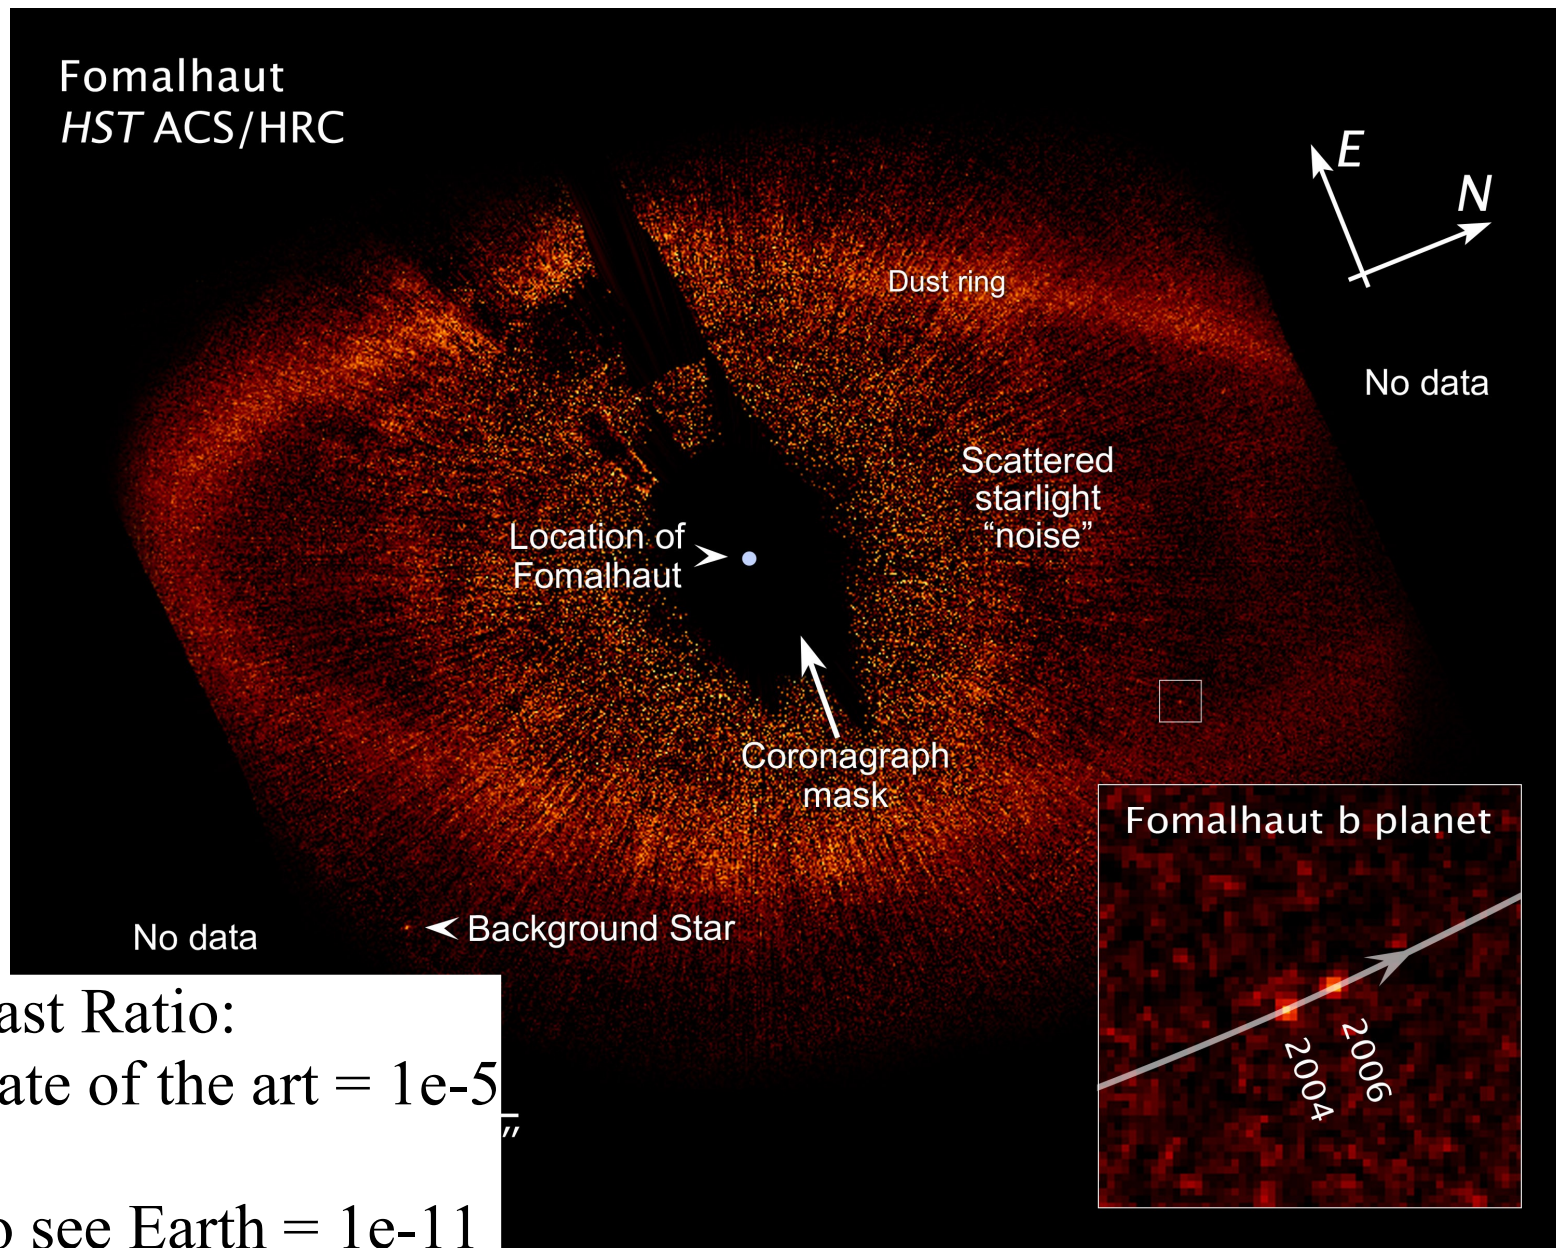

These are planets that you can't see orbiting stars that you can't see.

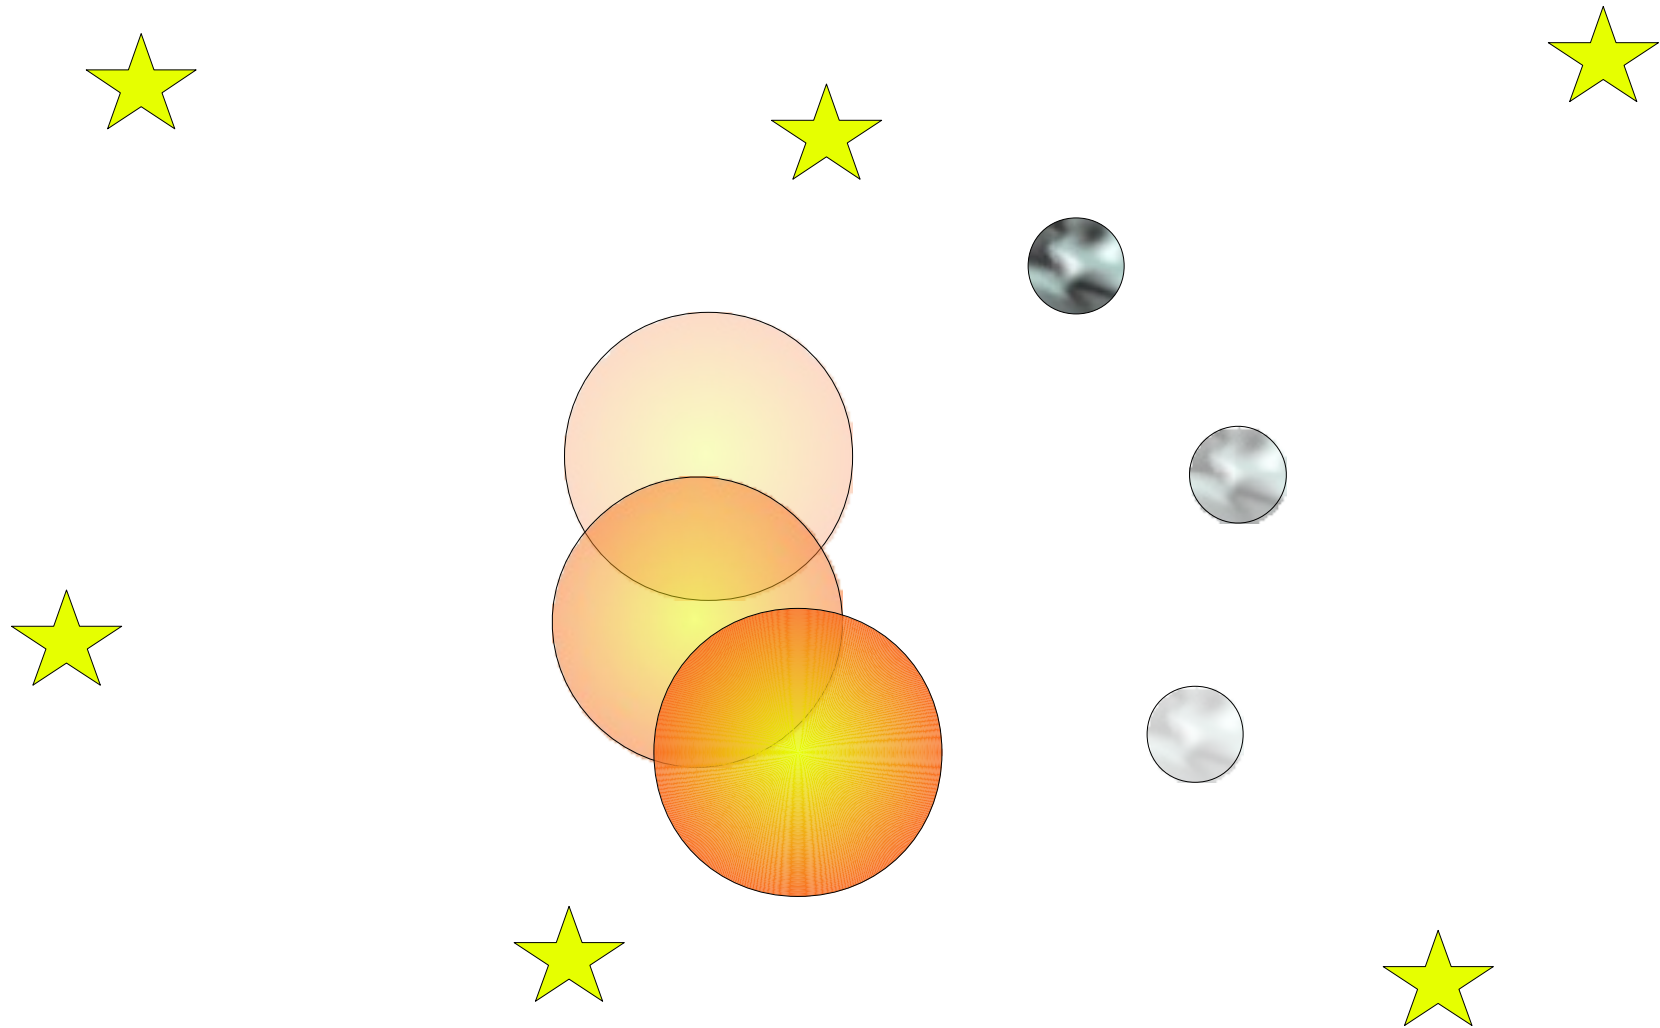

# Planet Finding: Direct Imaging

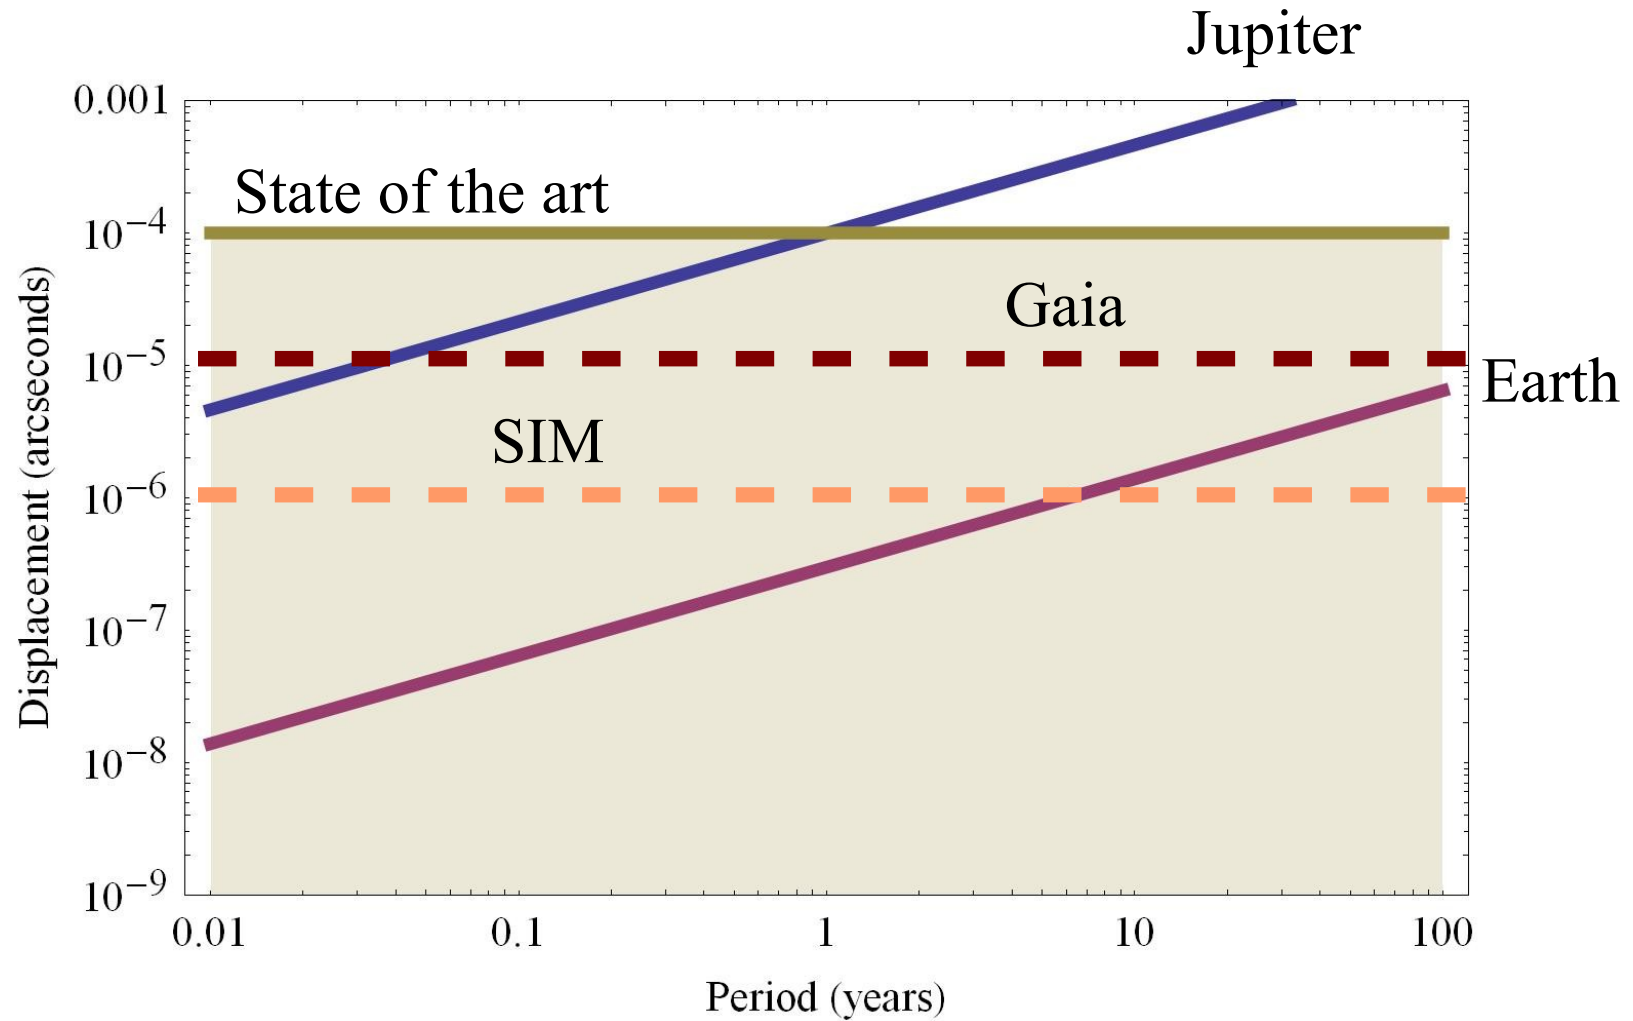

# Planet Finding: Direct Imaging

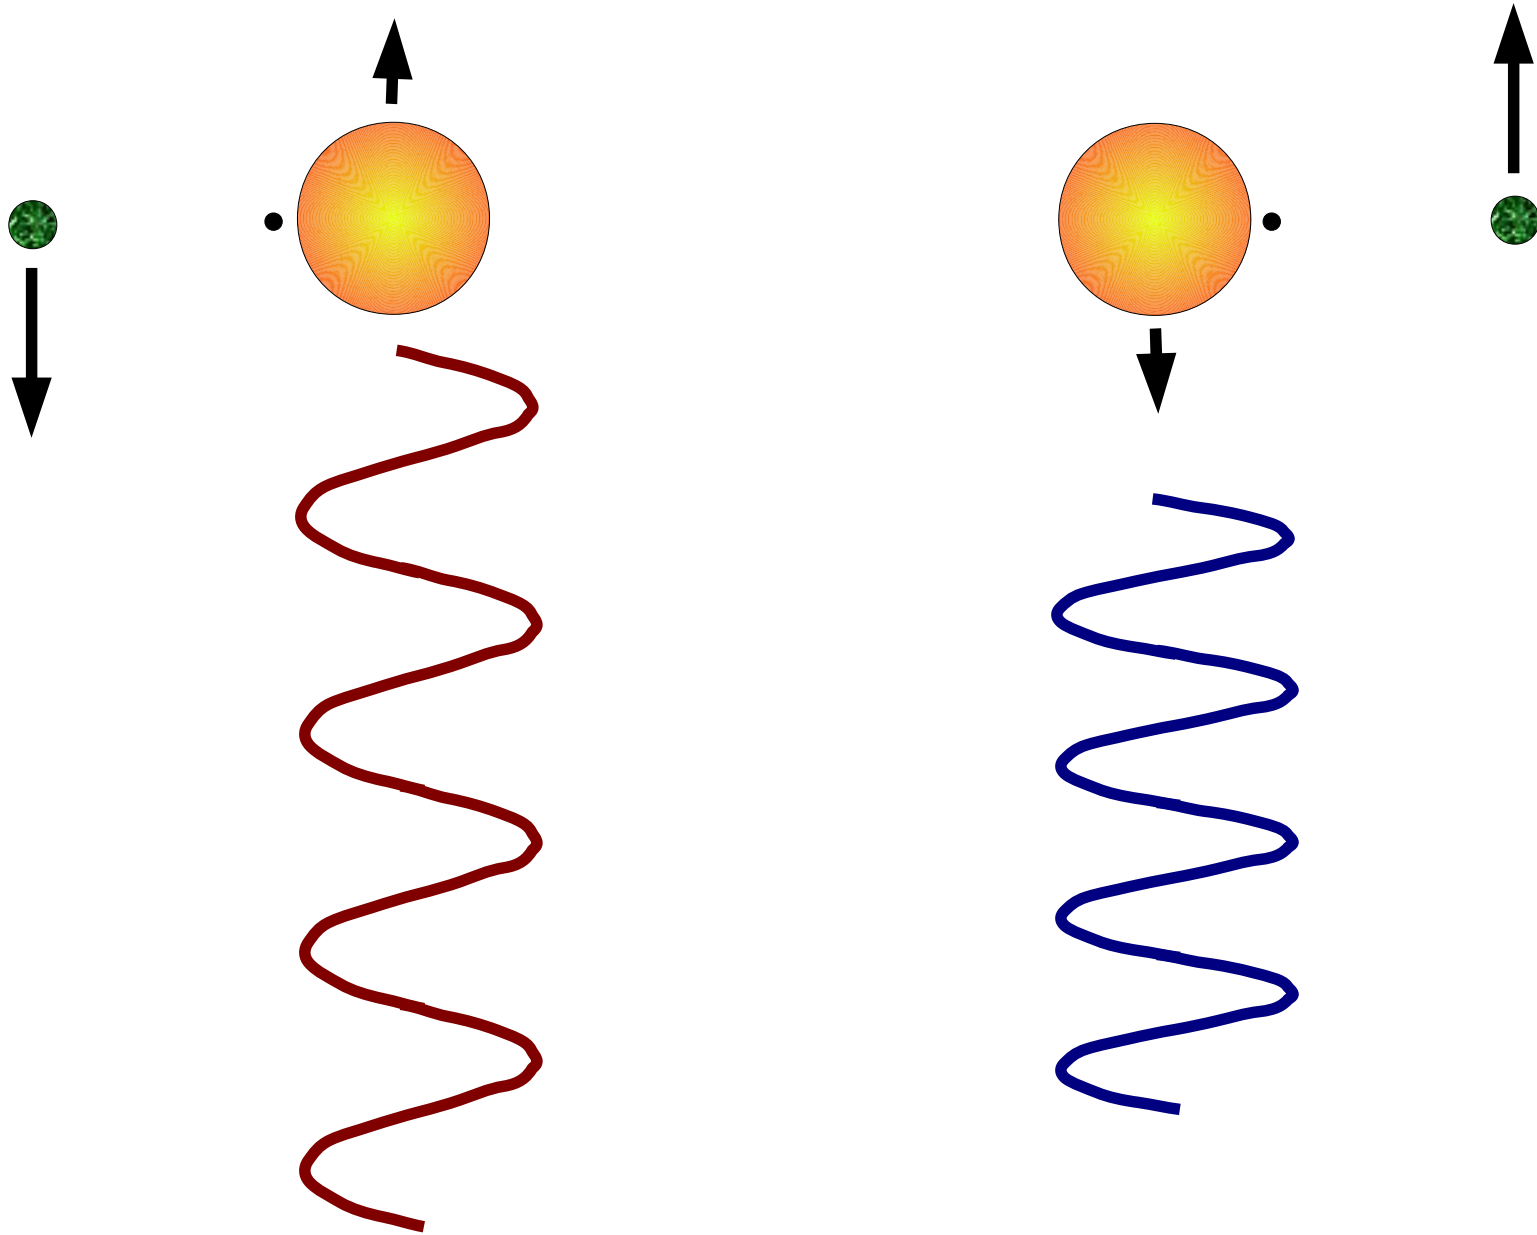

# Planet Finding: Astrometry

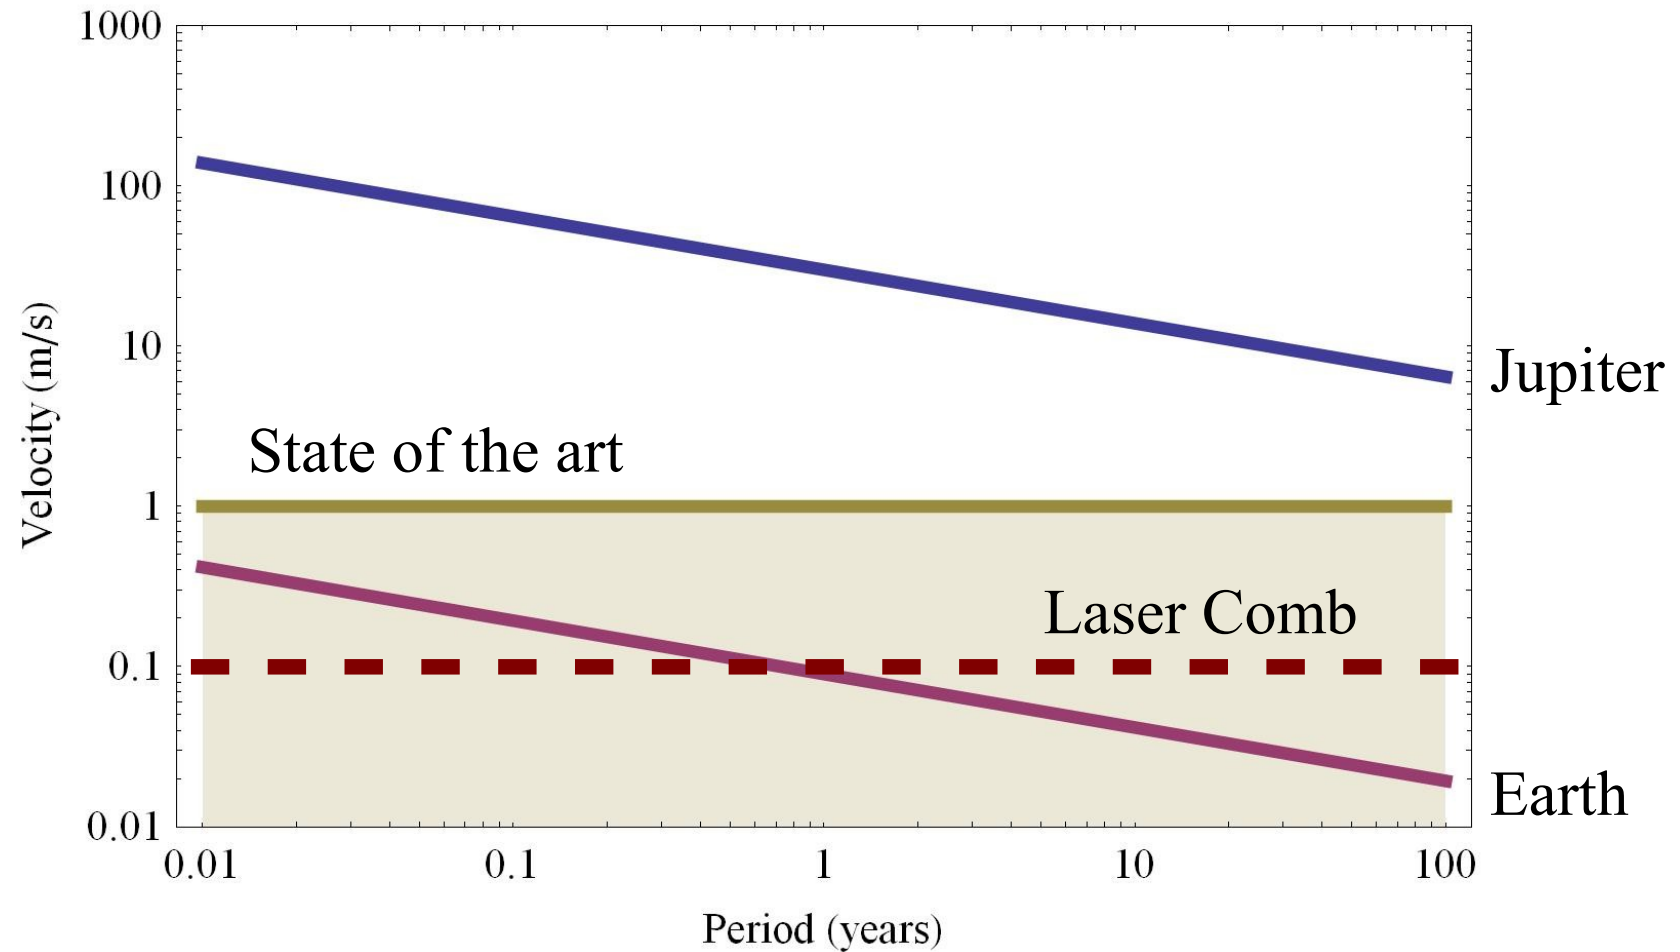

# Planet Finding: Astrometry

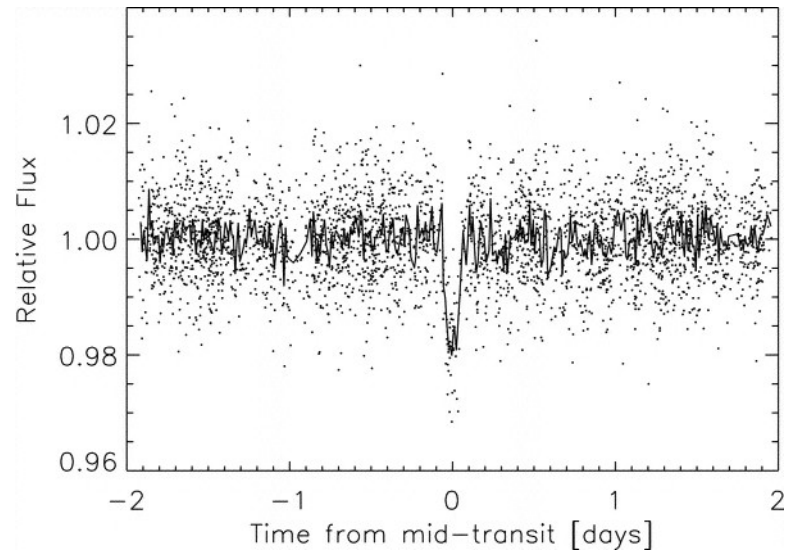

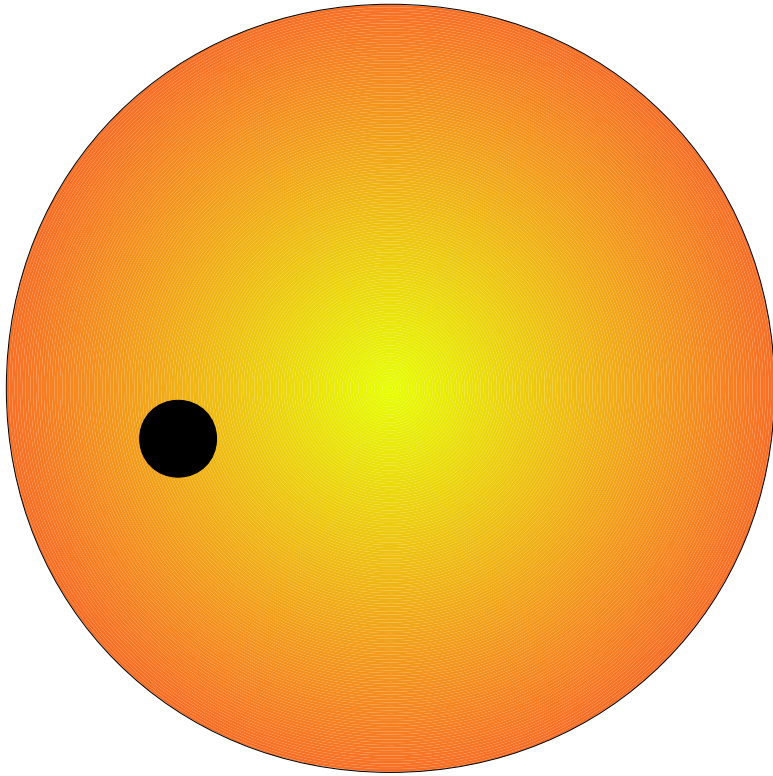

# Planet Finding: Radial Velocity

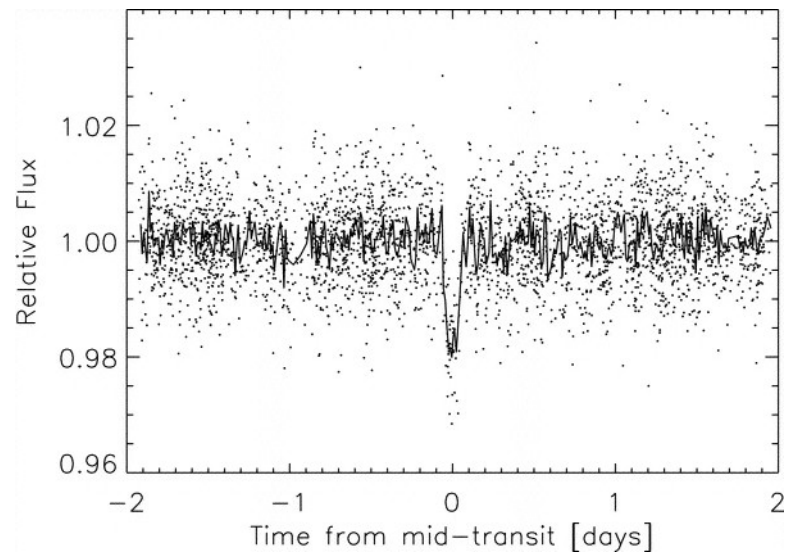

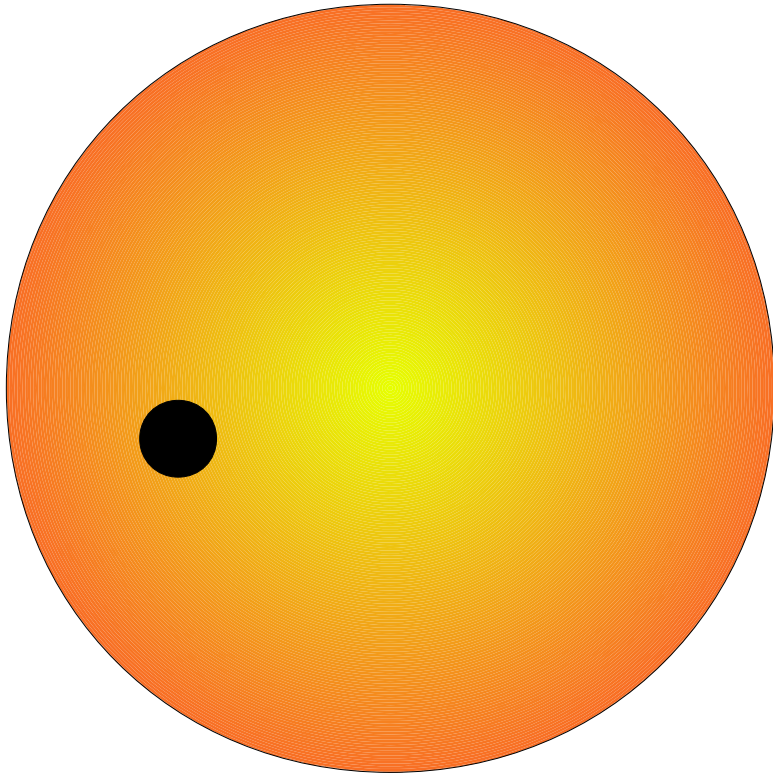

# Planet Finding: Radial Velocity

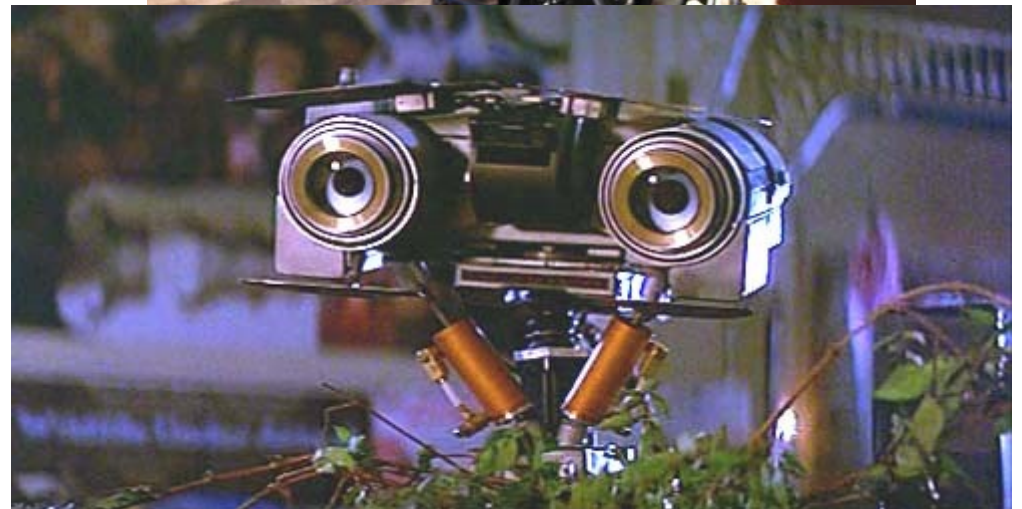

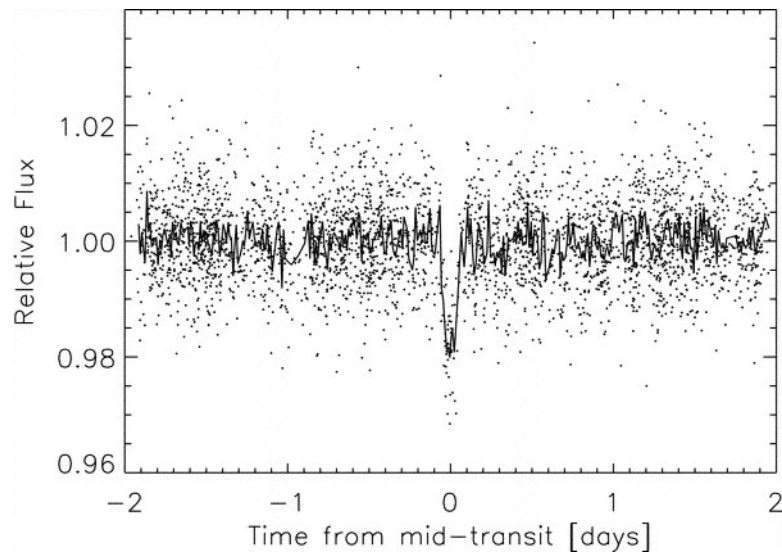

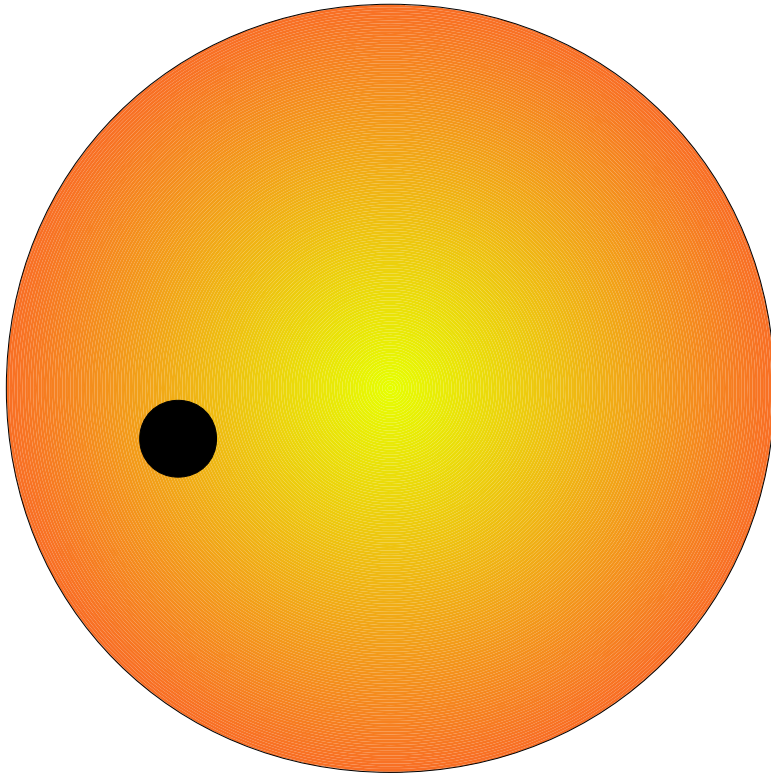

# Planet Finding: Transits

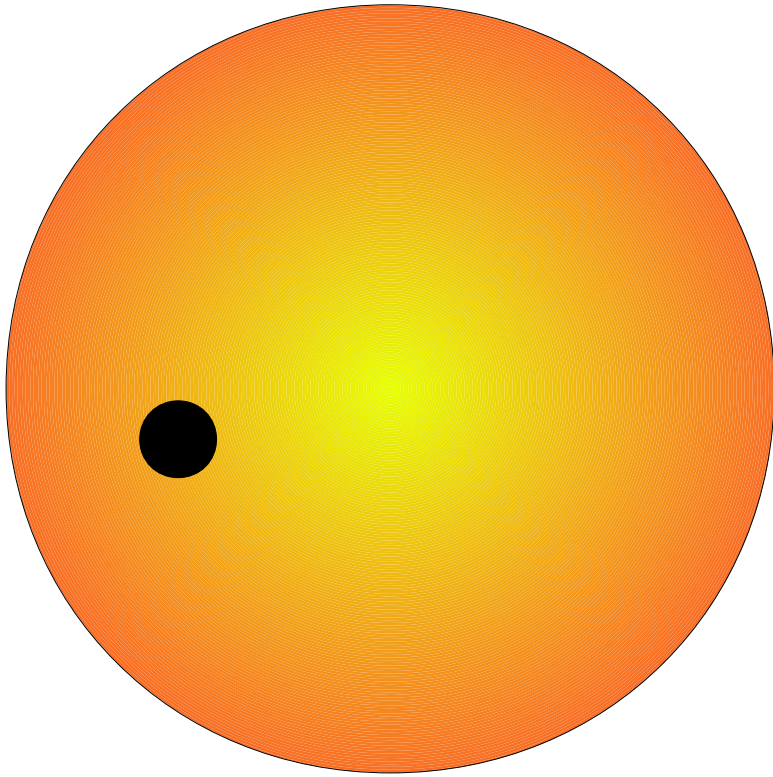

# Planet Finding: Transits

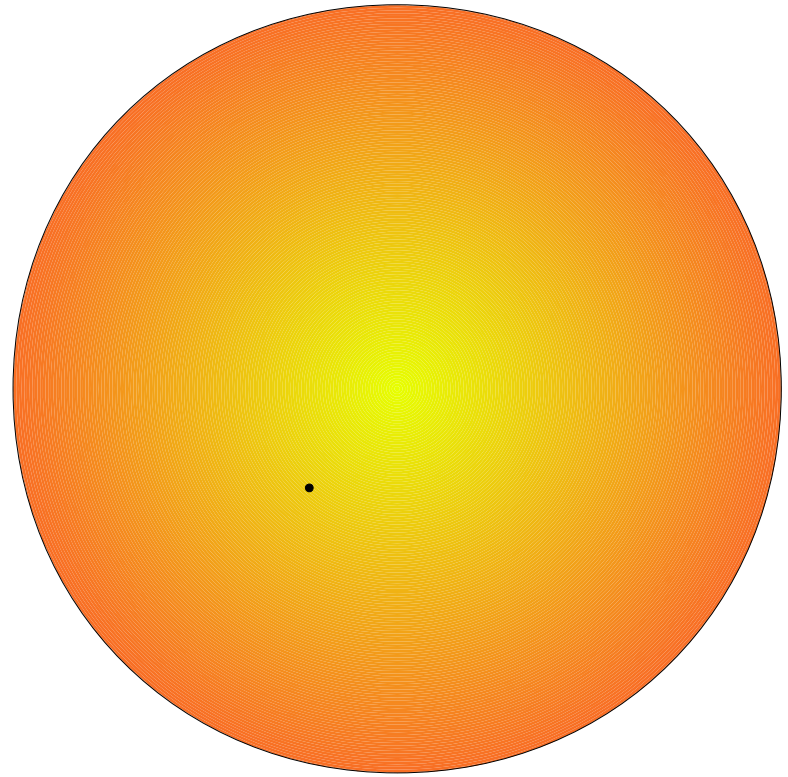

# Planet Finding: Transits

# Planet Finding with Kepler

Jupiter: need 1 part per 1000.

Earth: need 1 part per 100,000.

# Questions Addressed by Kepler

- What is the frequency of Earth-size planets in or near the Habitable Zone (HZ) of solar-like stars?
  - Are terrestrial planets common or rare?
- What are the distributions of planet sizes & semi-major axes?
- What are the frequency & orbital distributions of planets in multiple star systems?
- What are the distributions of semi-major axes, albedo, size, mass, and density of short-period giant planets?
- How are these properties associated with stellar characteristics?

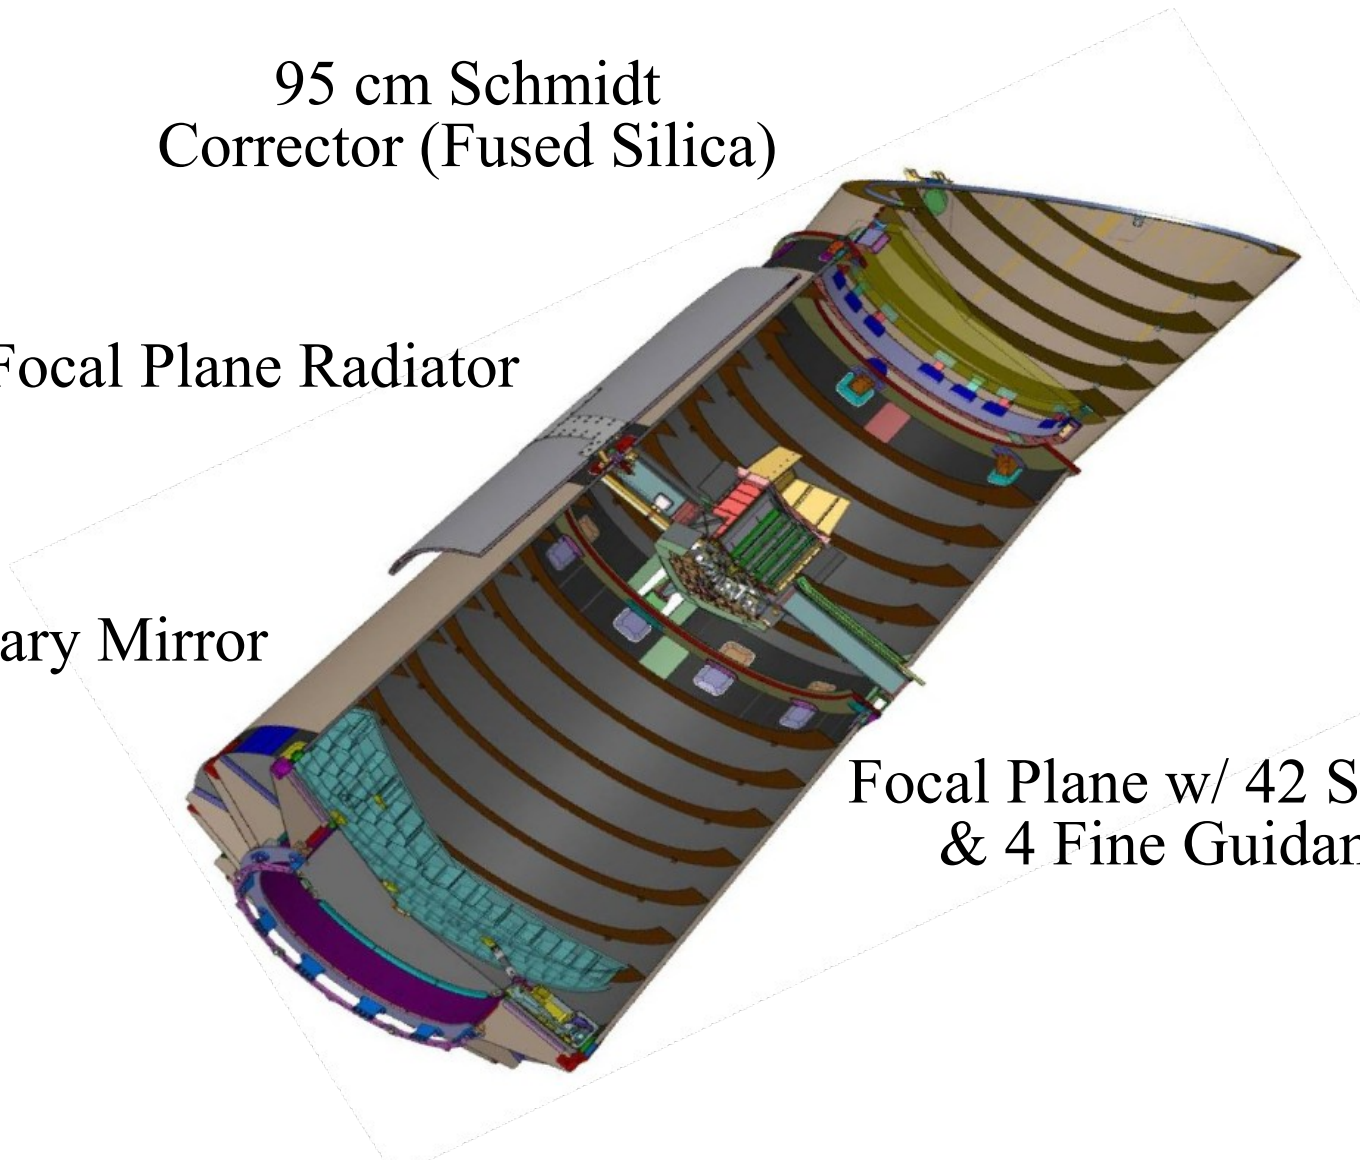

# Kepler Spacecraft

95 cm Schmidt  
Corrector (Fused Silica)

Focal Plane Radiator

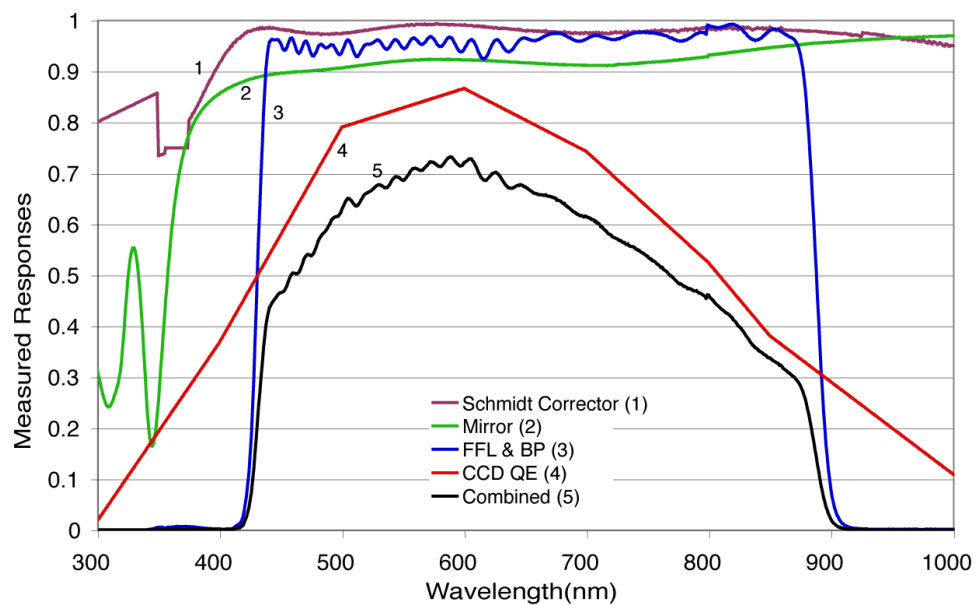

1.4m Primary Mirror

Focal Plane w/ 42 Science CCD's  
& 4 Fine Guidance Sensors

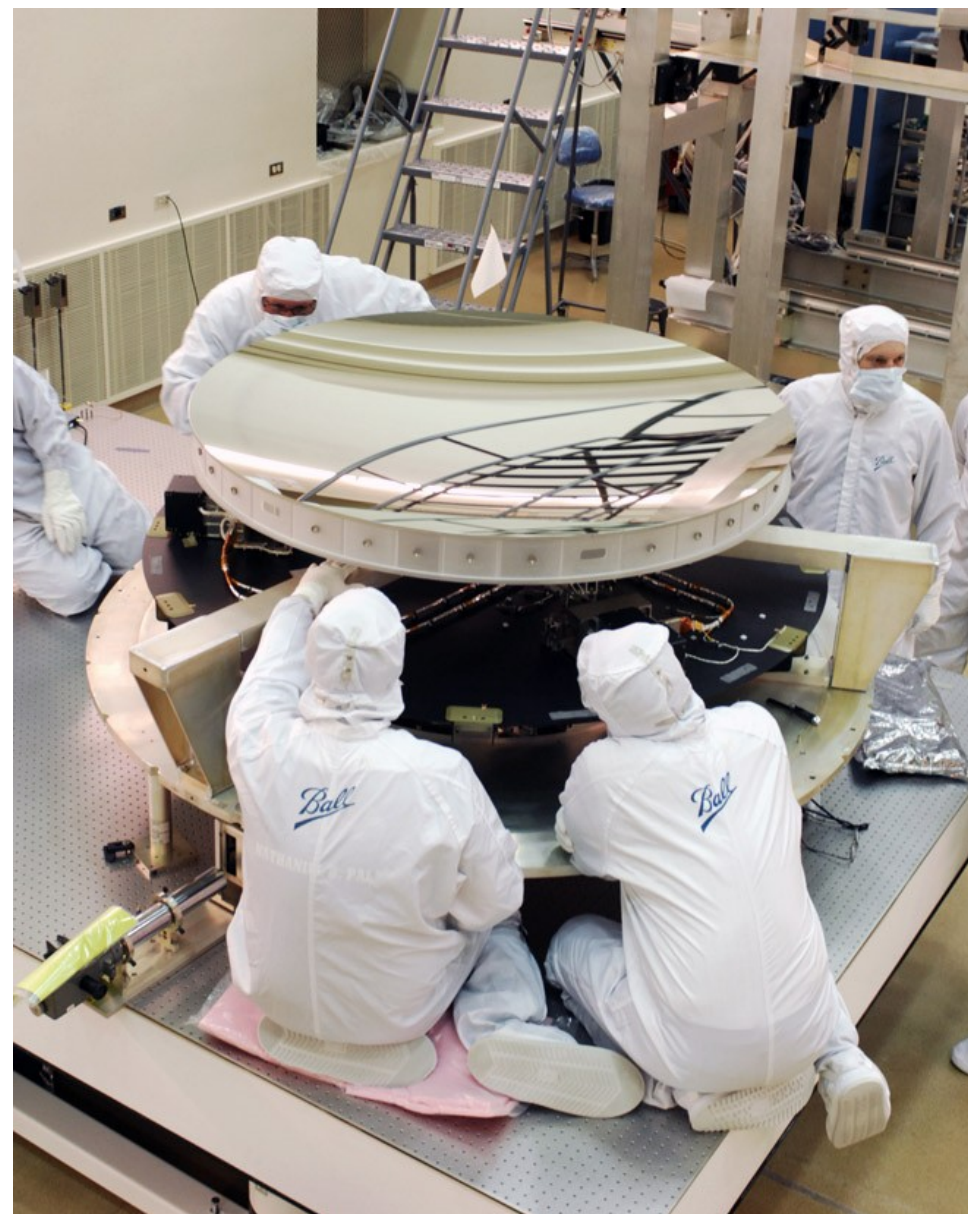

# Kepler Instrument Design

Overall spectral throughput.

Kepler primary mirror

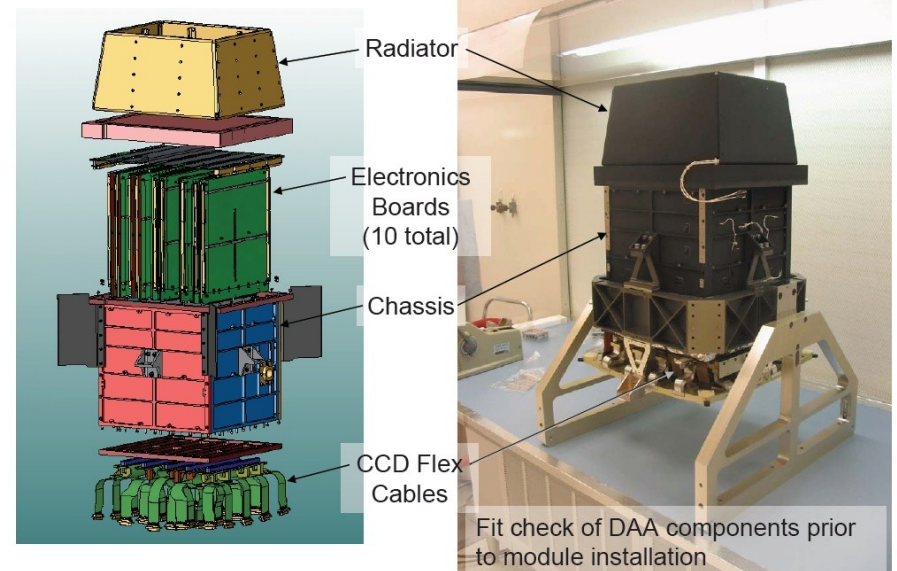

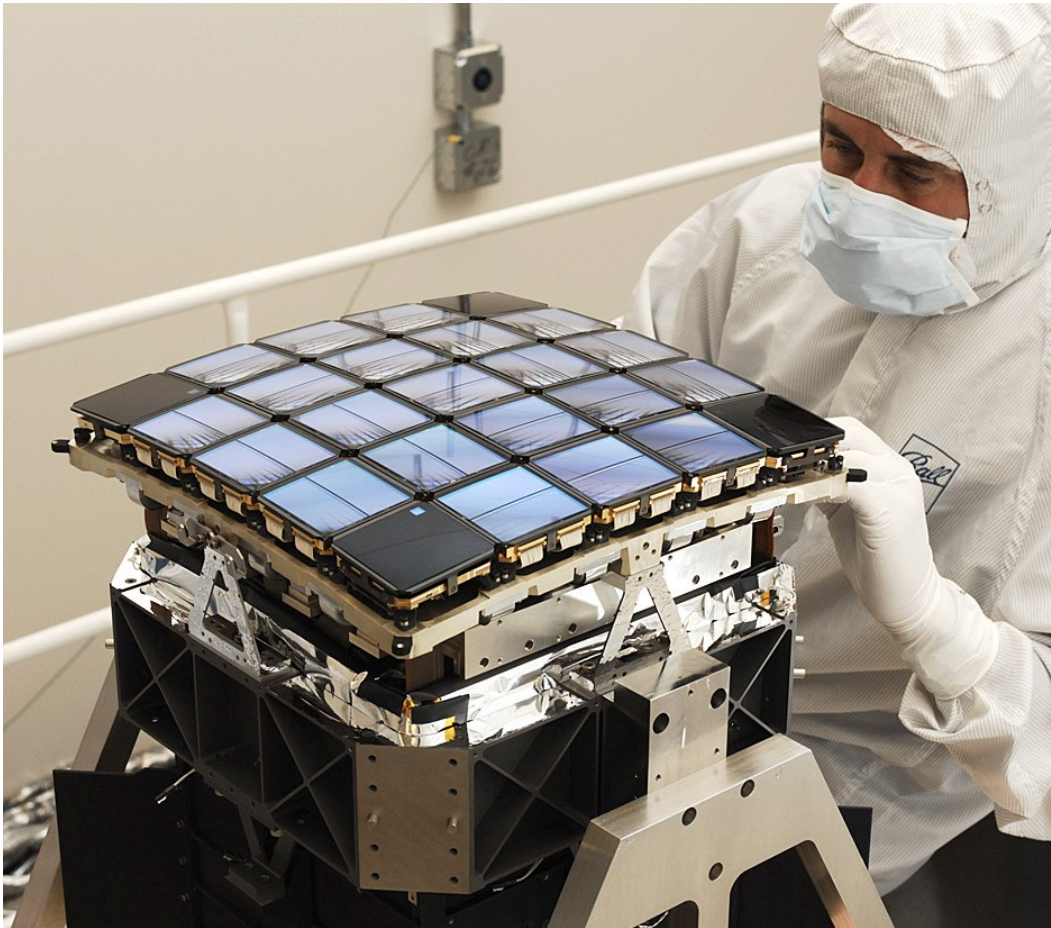

# Kepler Photometer

42 CCD chips, 95 million pixels

Continuously monitor  
~150,000 target stars

Images are de-focused

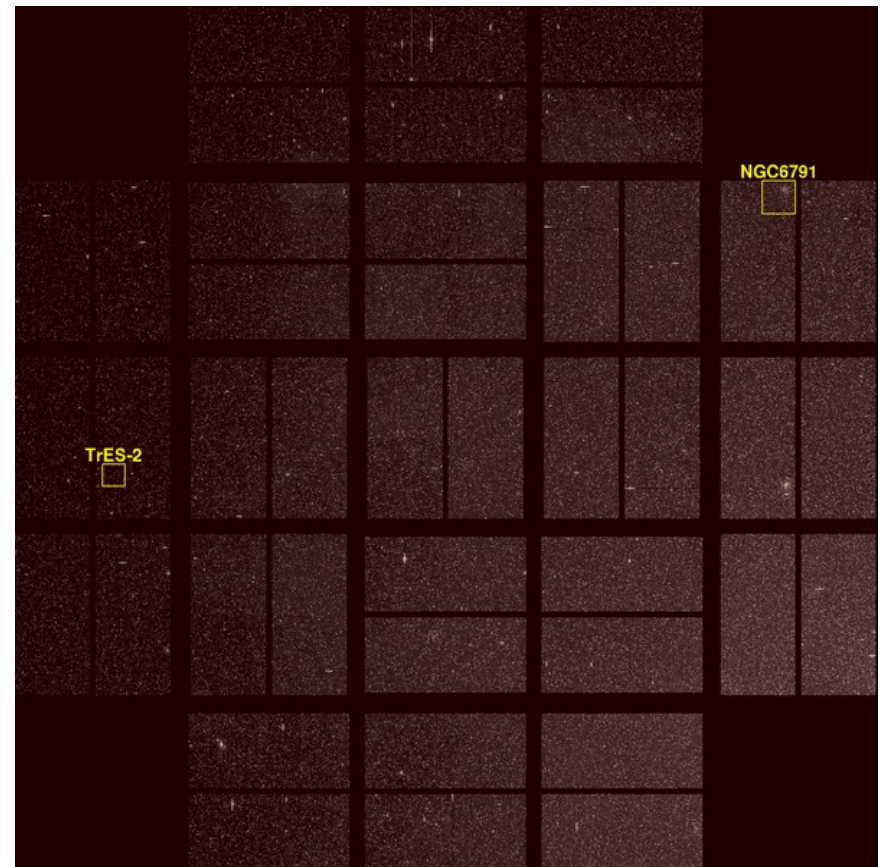

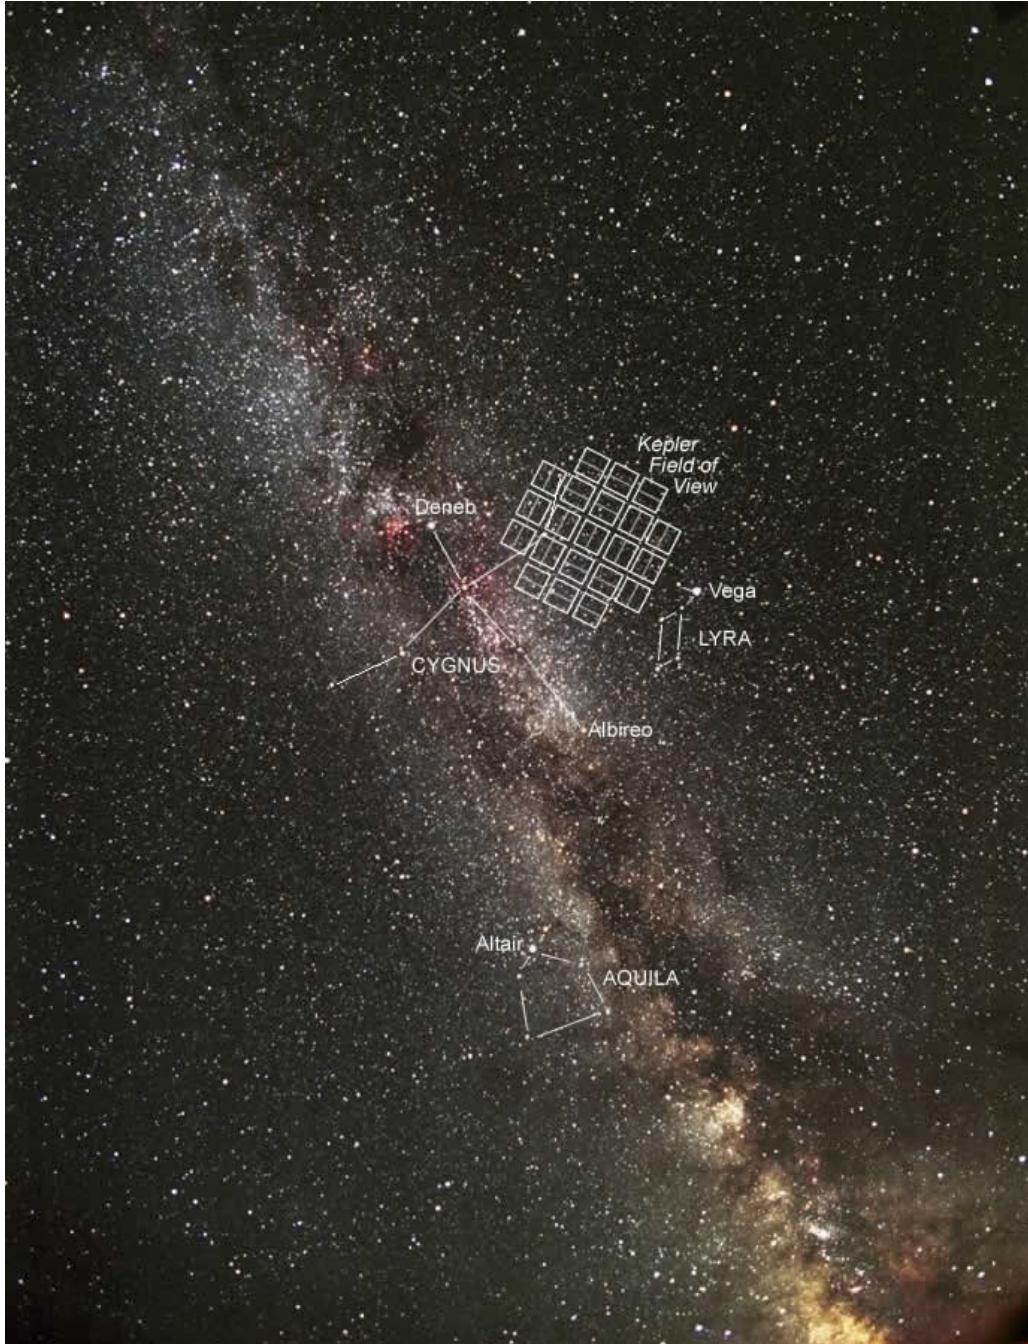

Only target pixels are  
sent back to Earth

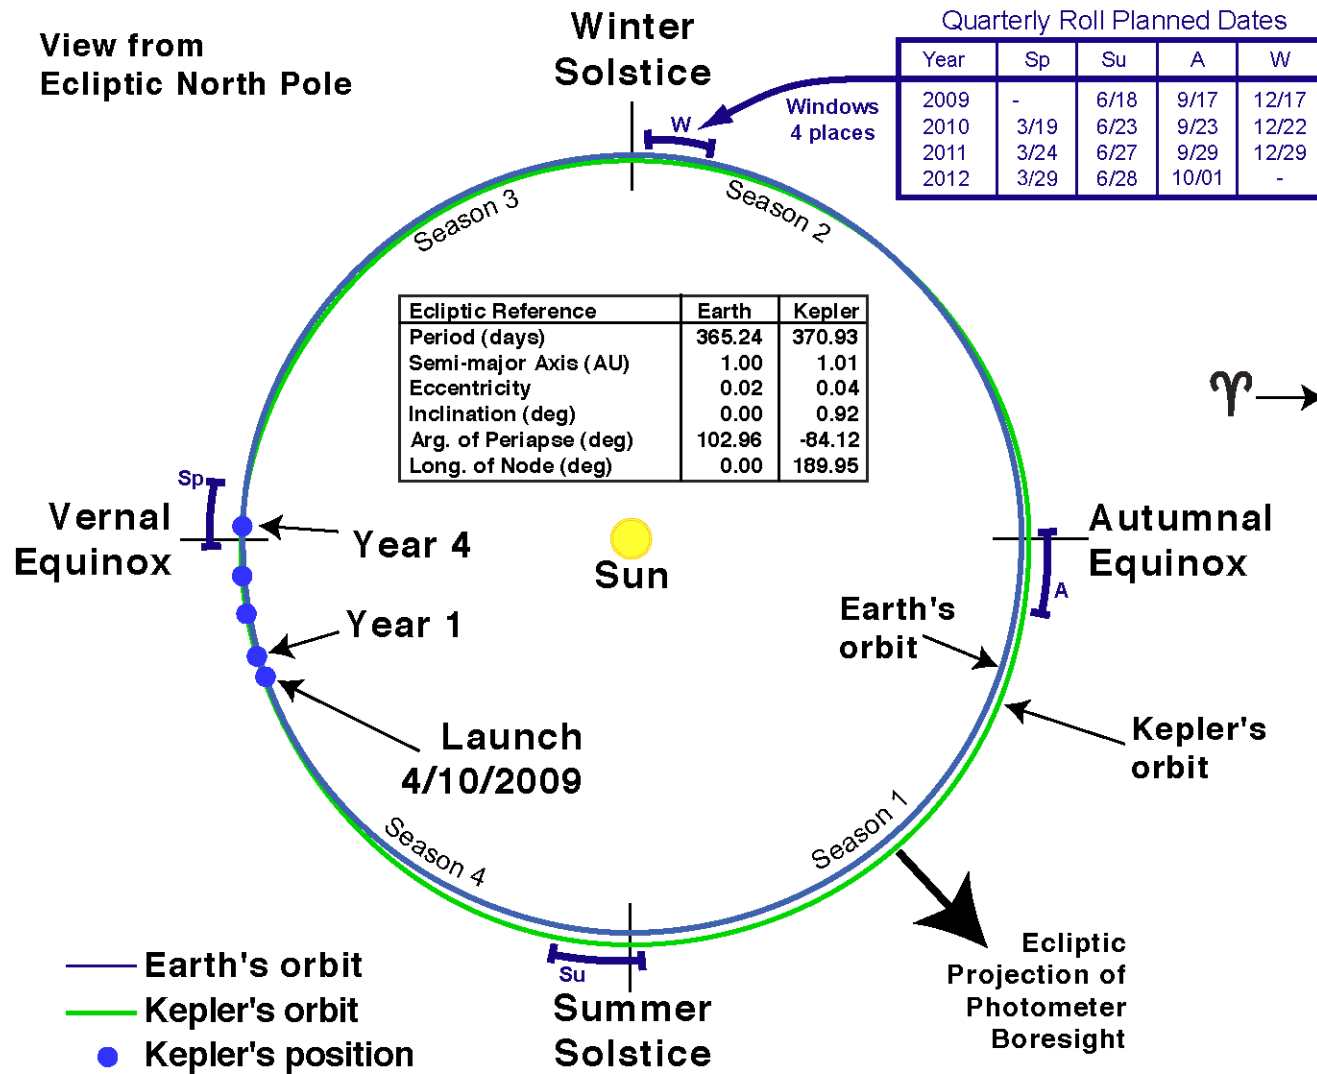

# Kepler Field of View

~100 square degrees

First light image

# Kepler Orbit

Keck 10m

HET 9m

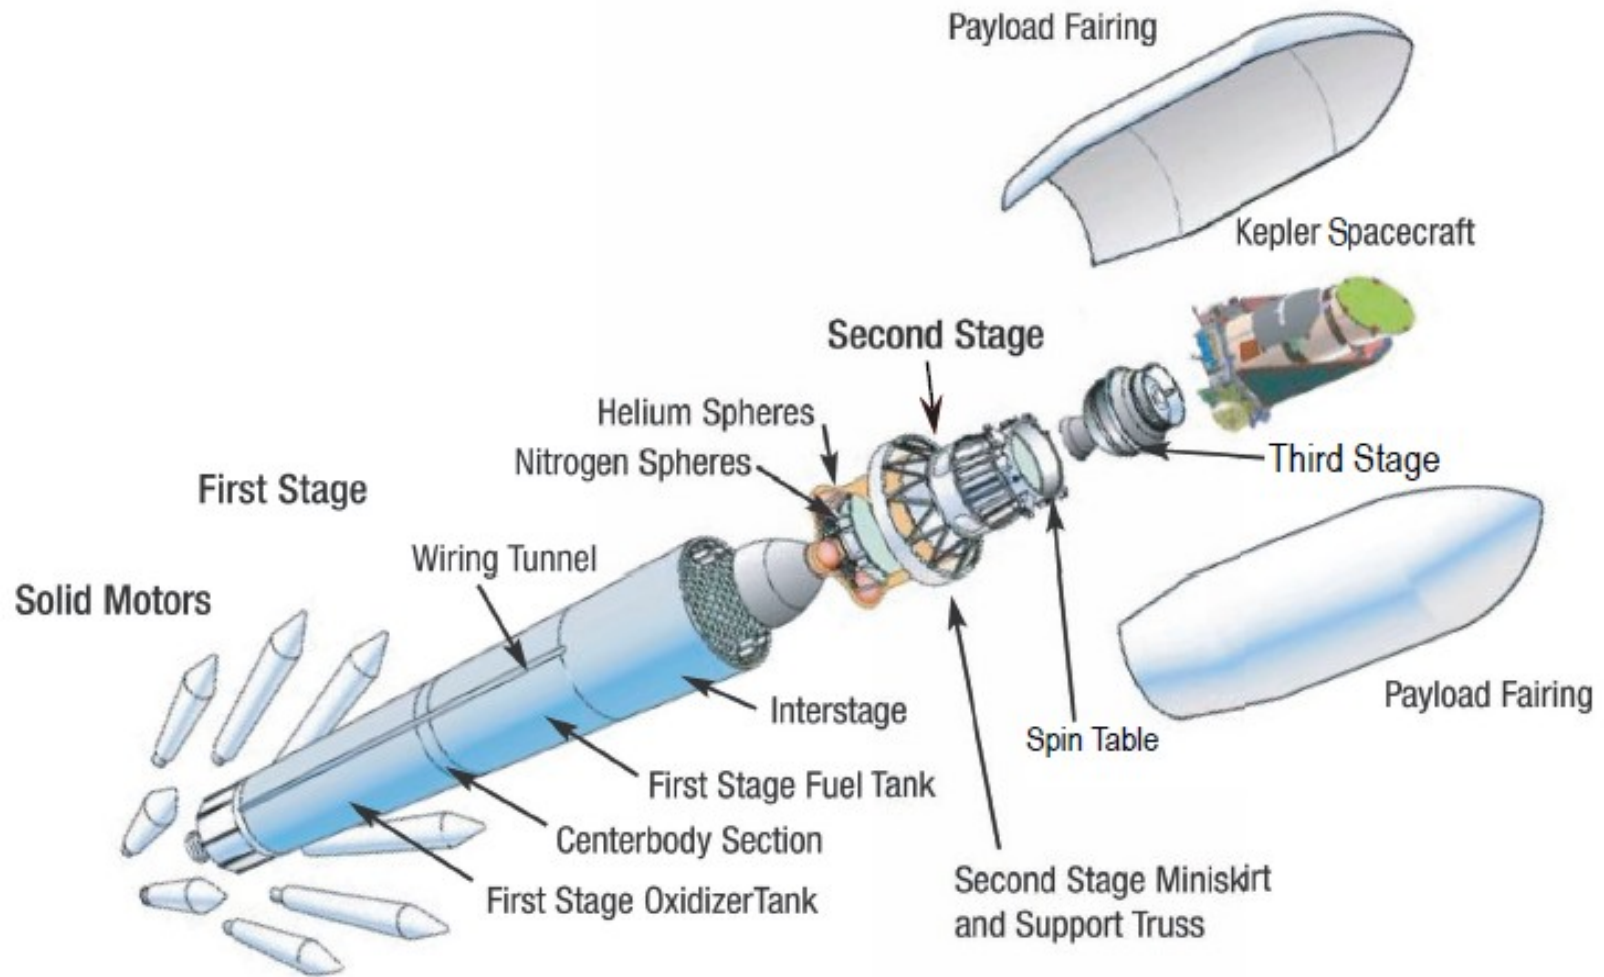

MMT 6.5m

# Ground-based Program

- Kepler input catalog
  - Stellar classification for target selection
- Low resolution spectroscopy
  - Used to remove some false positive systems
- High spacial resolution imaging
  - Adaptive optics and speckle interferometry
  - Used to remove confusion due to crowding
- High resolution spectroscopy
  - Used to measure the masses of detected planets
  - Used to confirm lack of detectable signal for small planets
- Cannot confirm planet nature with transits alone!

Many additional telescopes are used in ground-based program.

# Kepler Launch Vehicle

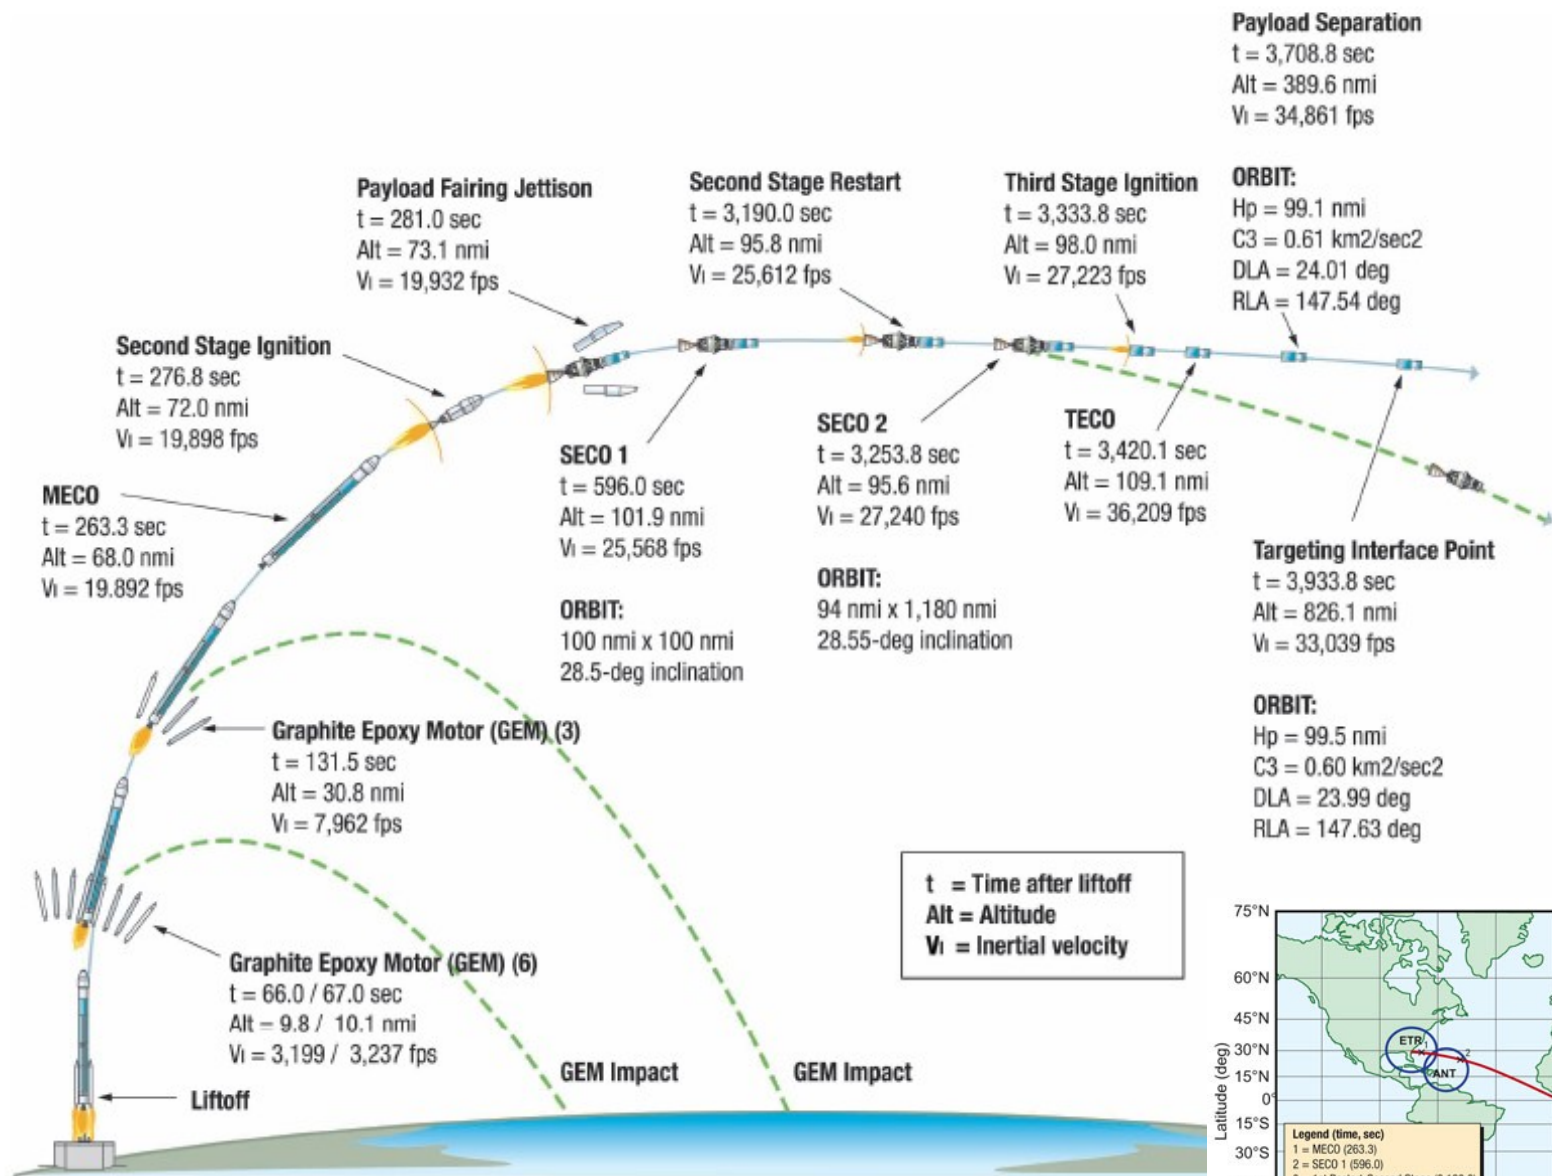

*Delta Launch Vehicle with Kepler Spacecraft*

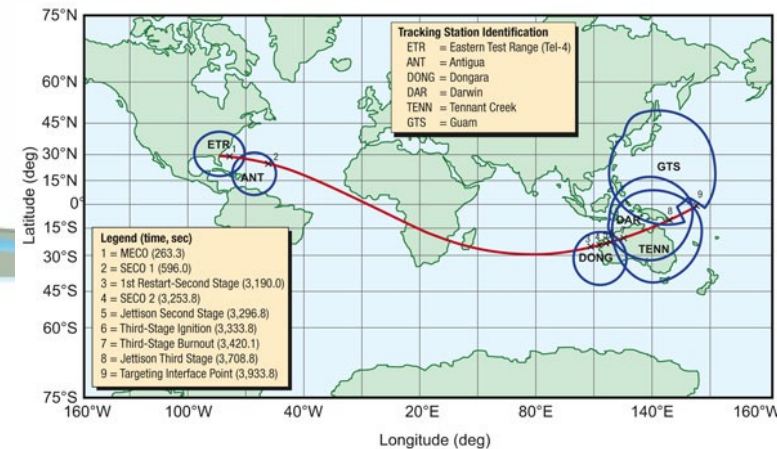

# Before and During

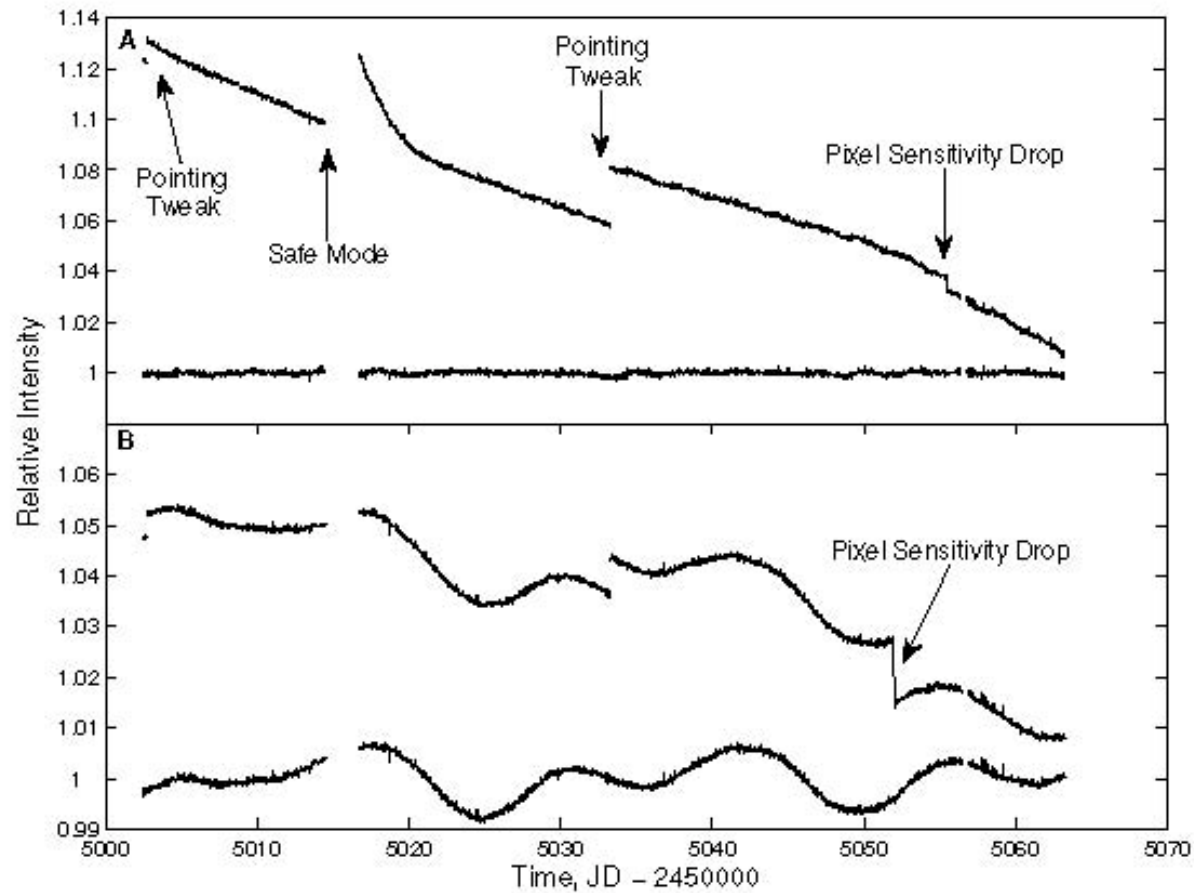

# Launch Sequence

Kepler Launch Profile

# Time Series Data

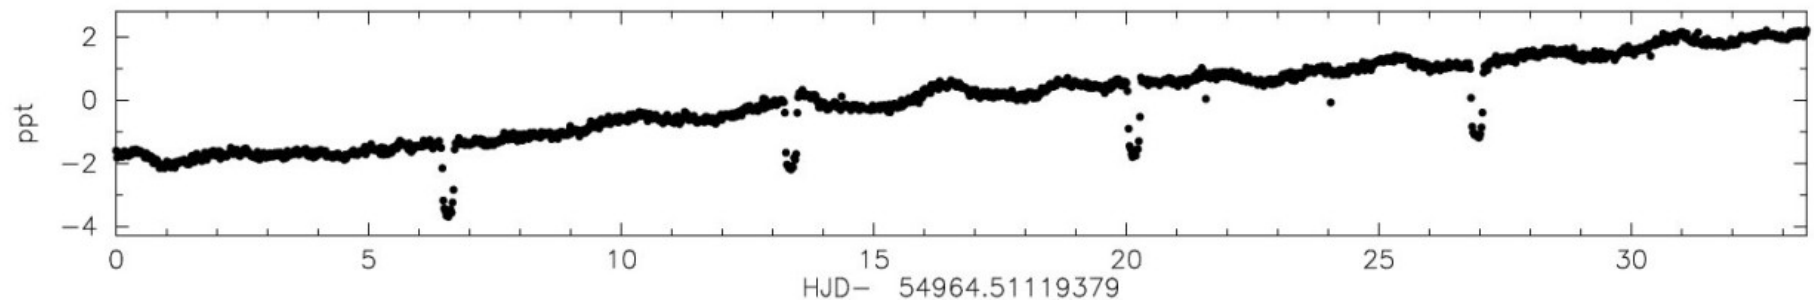

Before correction

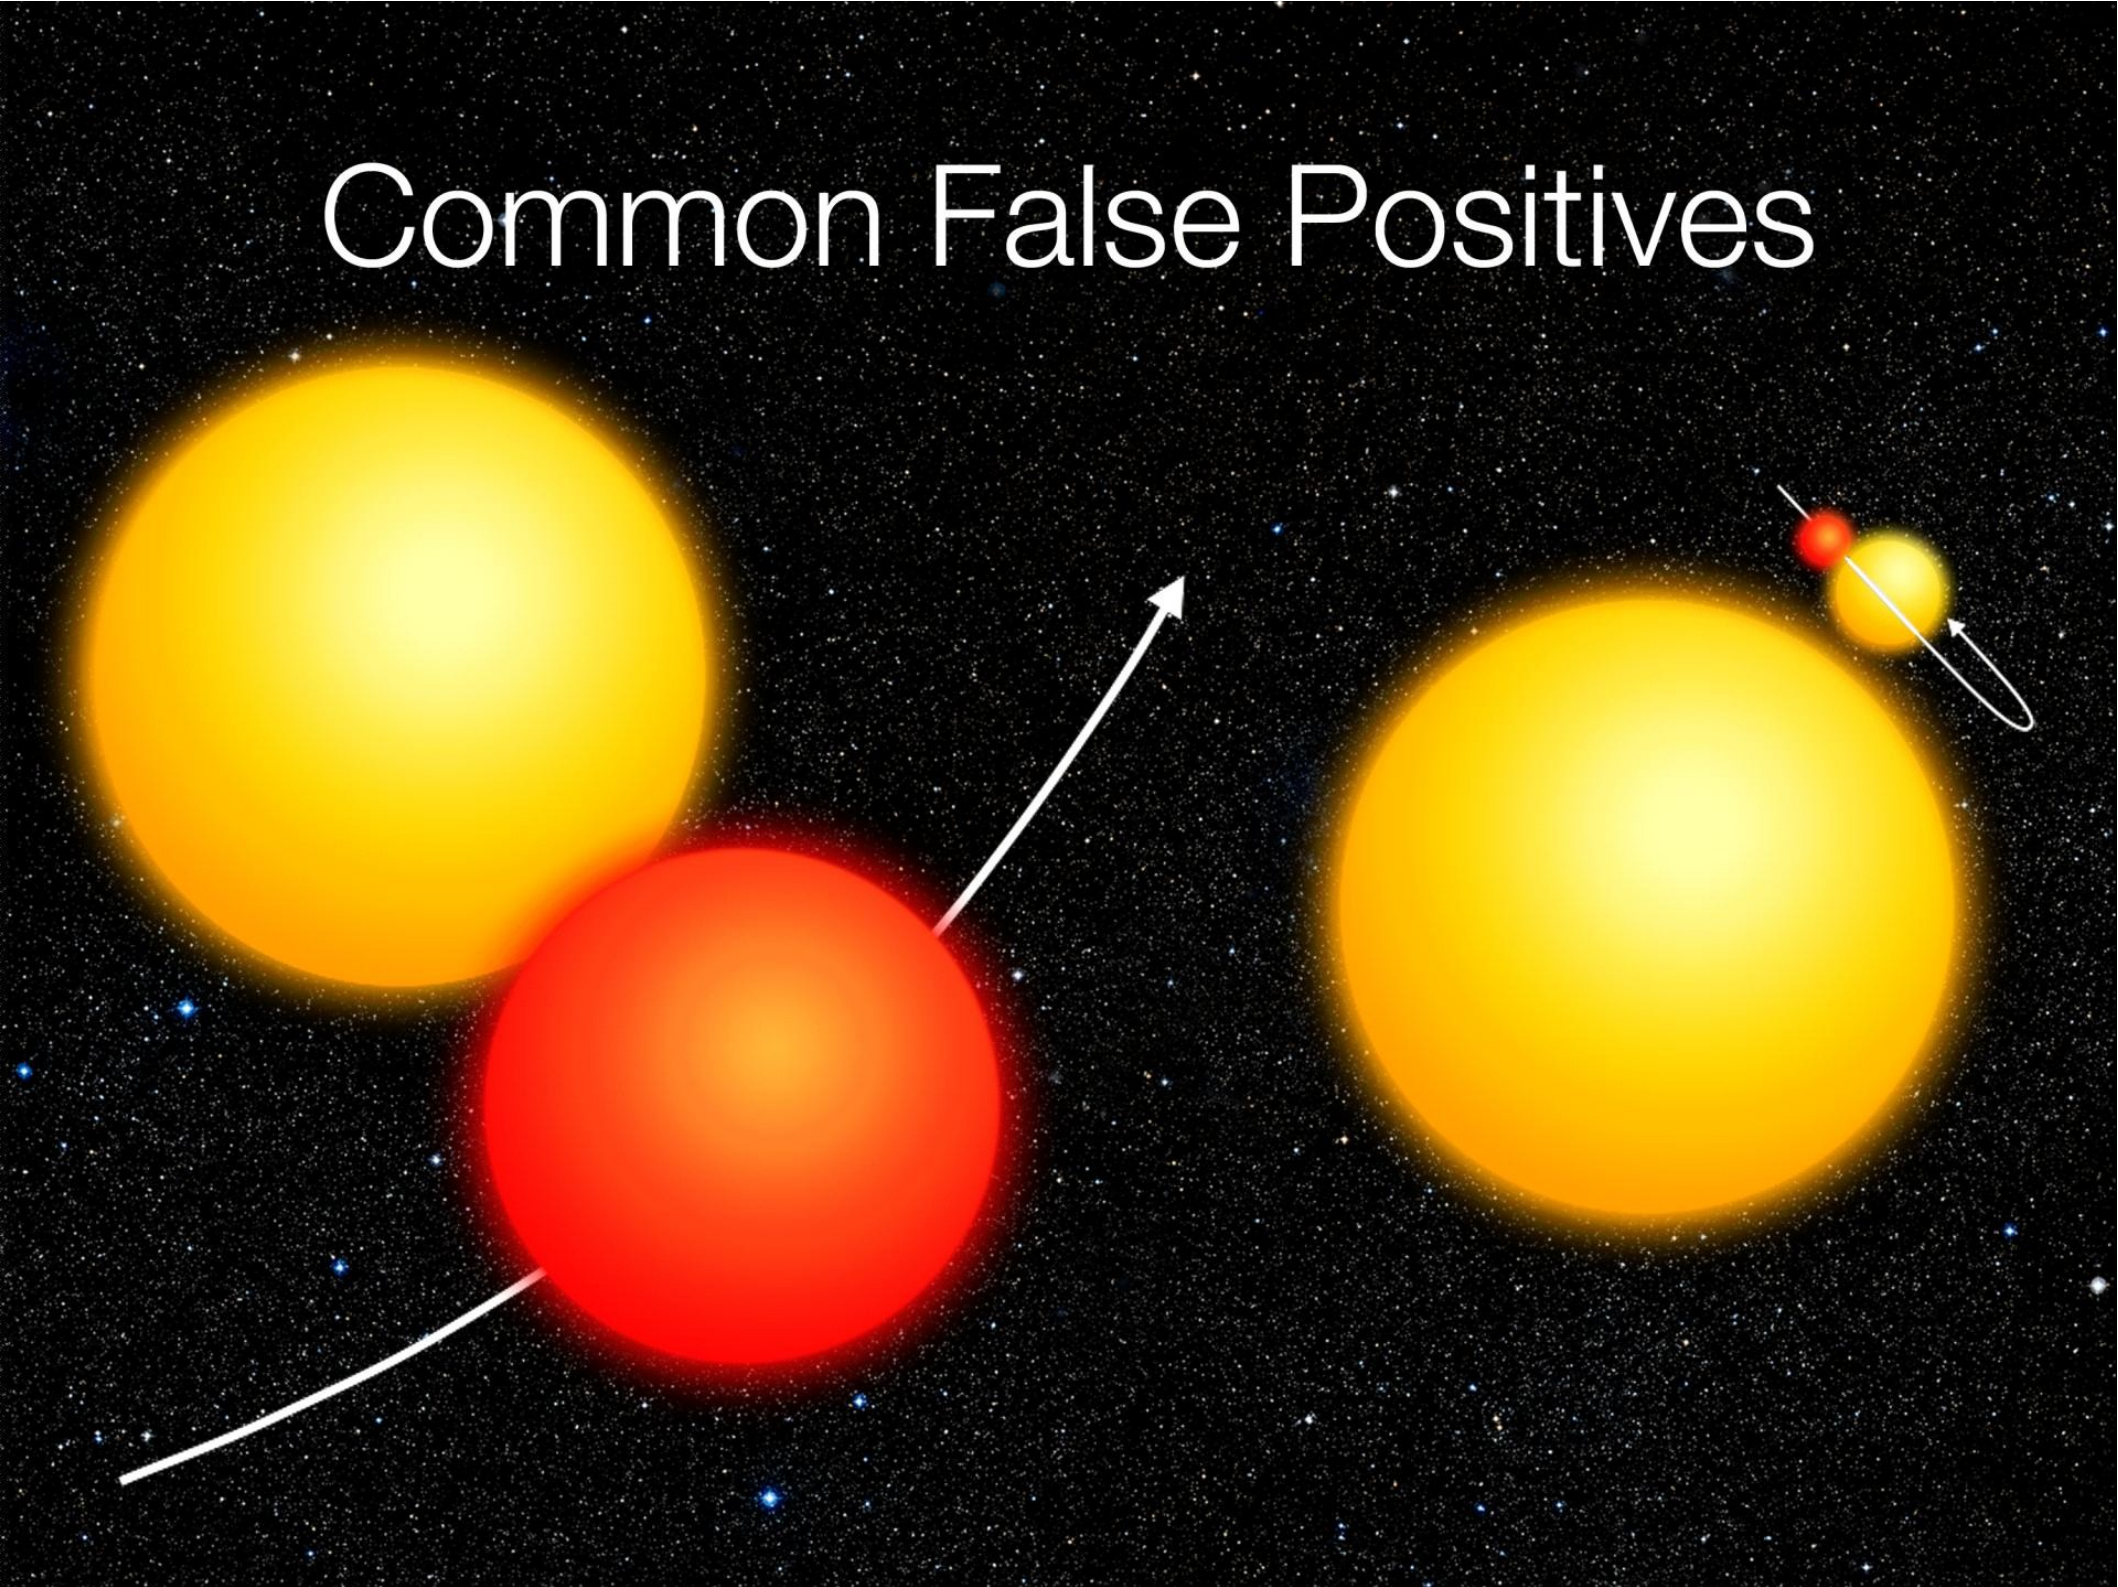

After correction

Before correction

After correction

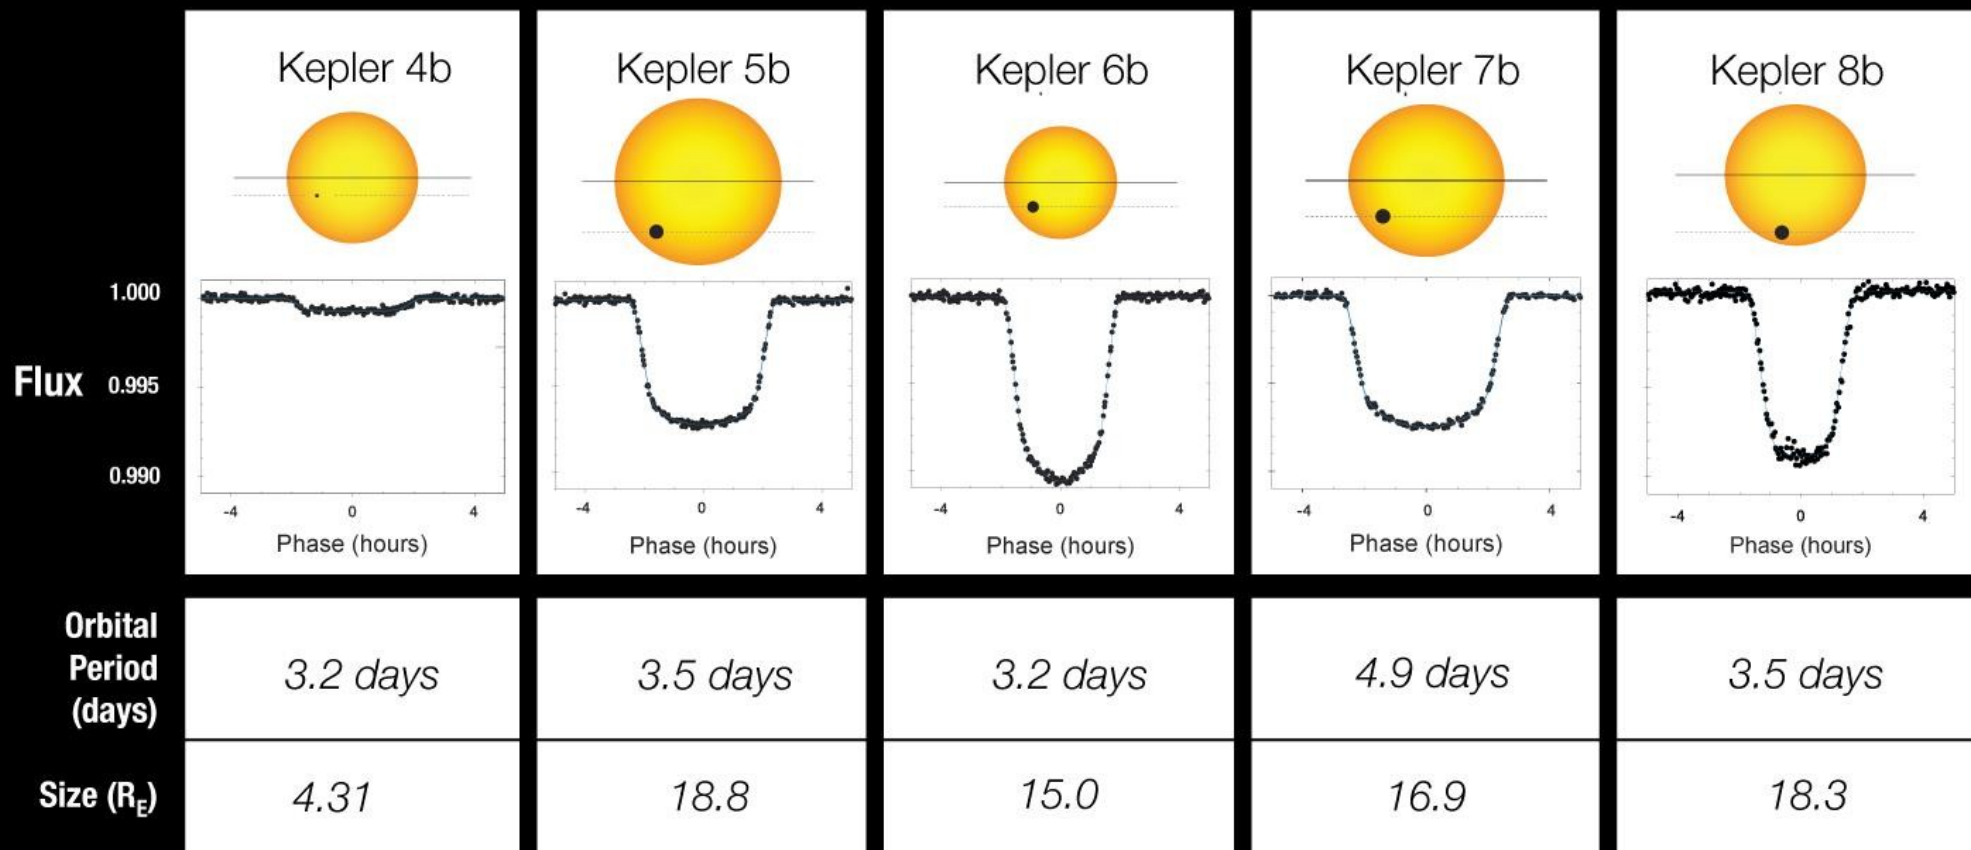

# Common False Positives

# Many are Candidates, Few are Planets

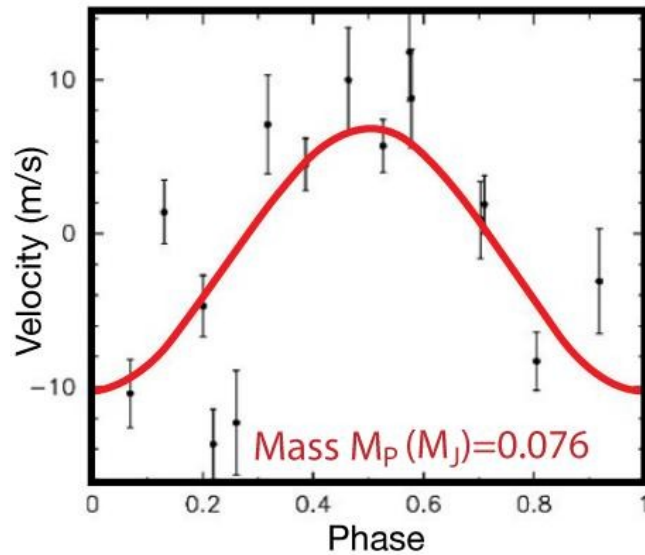

- $\text{SNR} > 7$  to rule out statistical fluctuations
- Three or more transits to confirm periodic signal
- Light curve depth, shape, and duration
- Image subtraction to identify signals from background stars
- Movement of stellar centroid to remove high-mass companions
- Radial velocity
  - Medium precision to rule out stellar companions
  - High precision to measure mass and confirm discoveries
  - Rossiter-McLaughlin effect also to confirm planets
- High spatial resolution to identify extremely close background stars

# Transit Light Curves

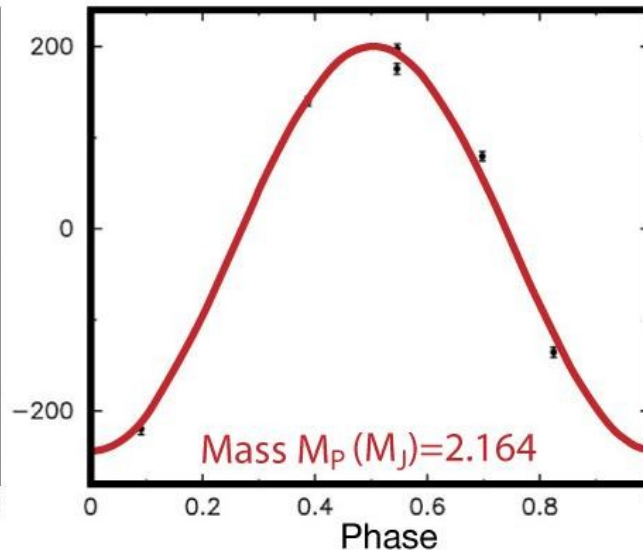

# Radial Velocity of Host Stars

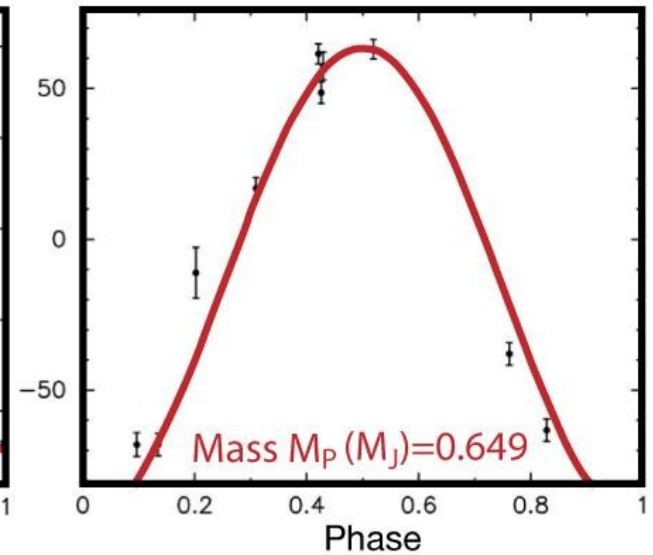

Kepler 4b

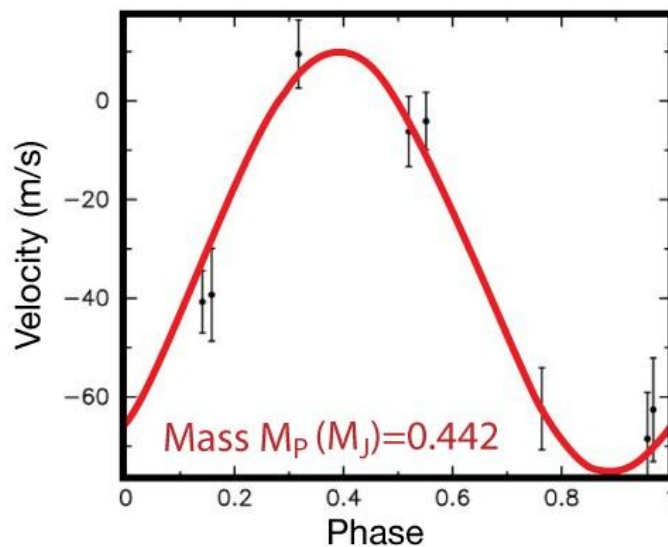

Kepler 5b

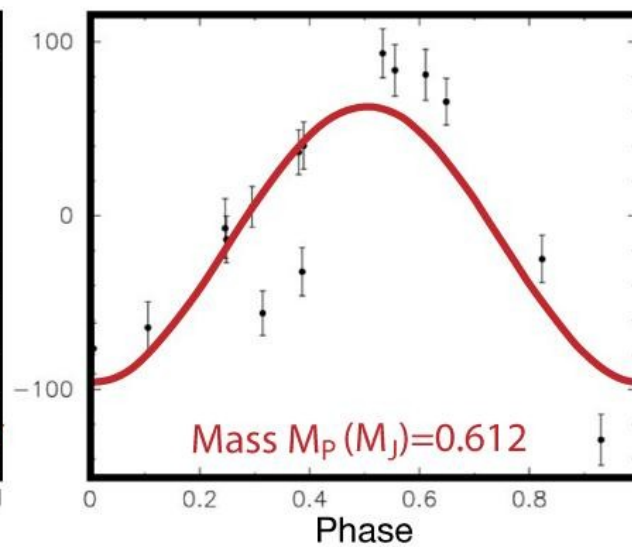

Kepler 6b

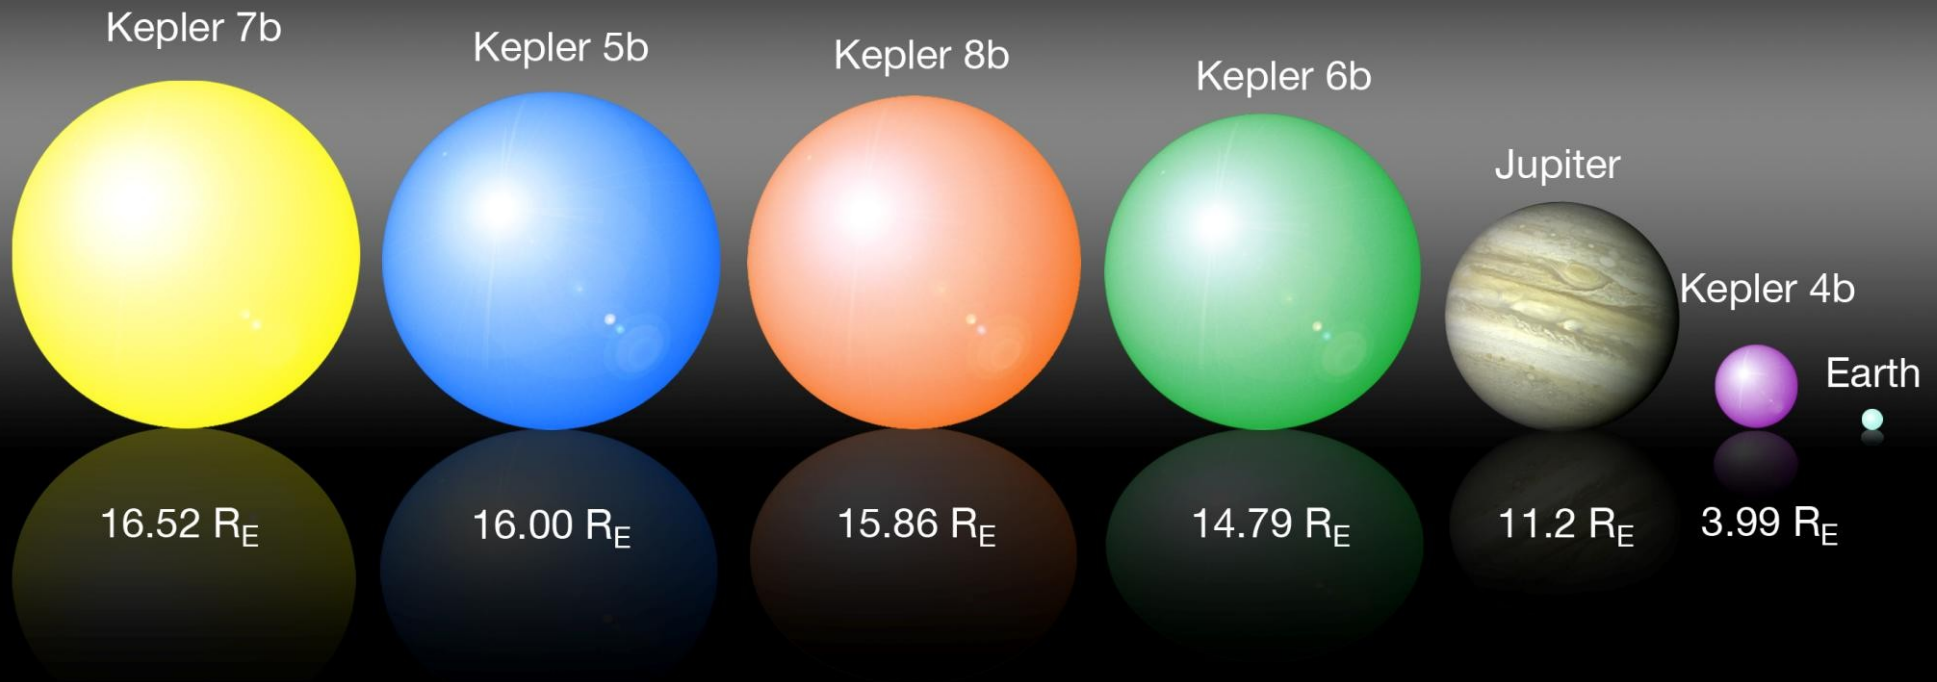

Kepler 7b

Kepler 8b

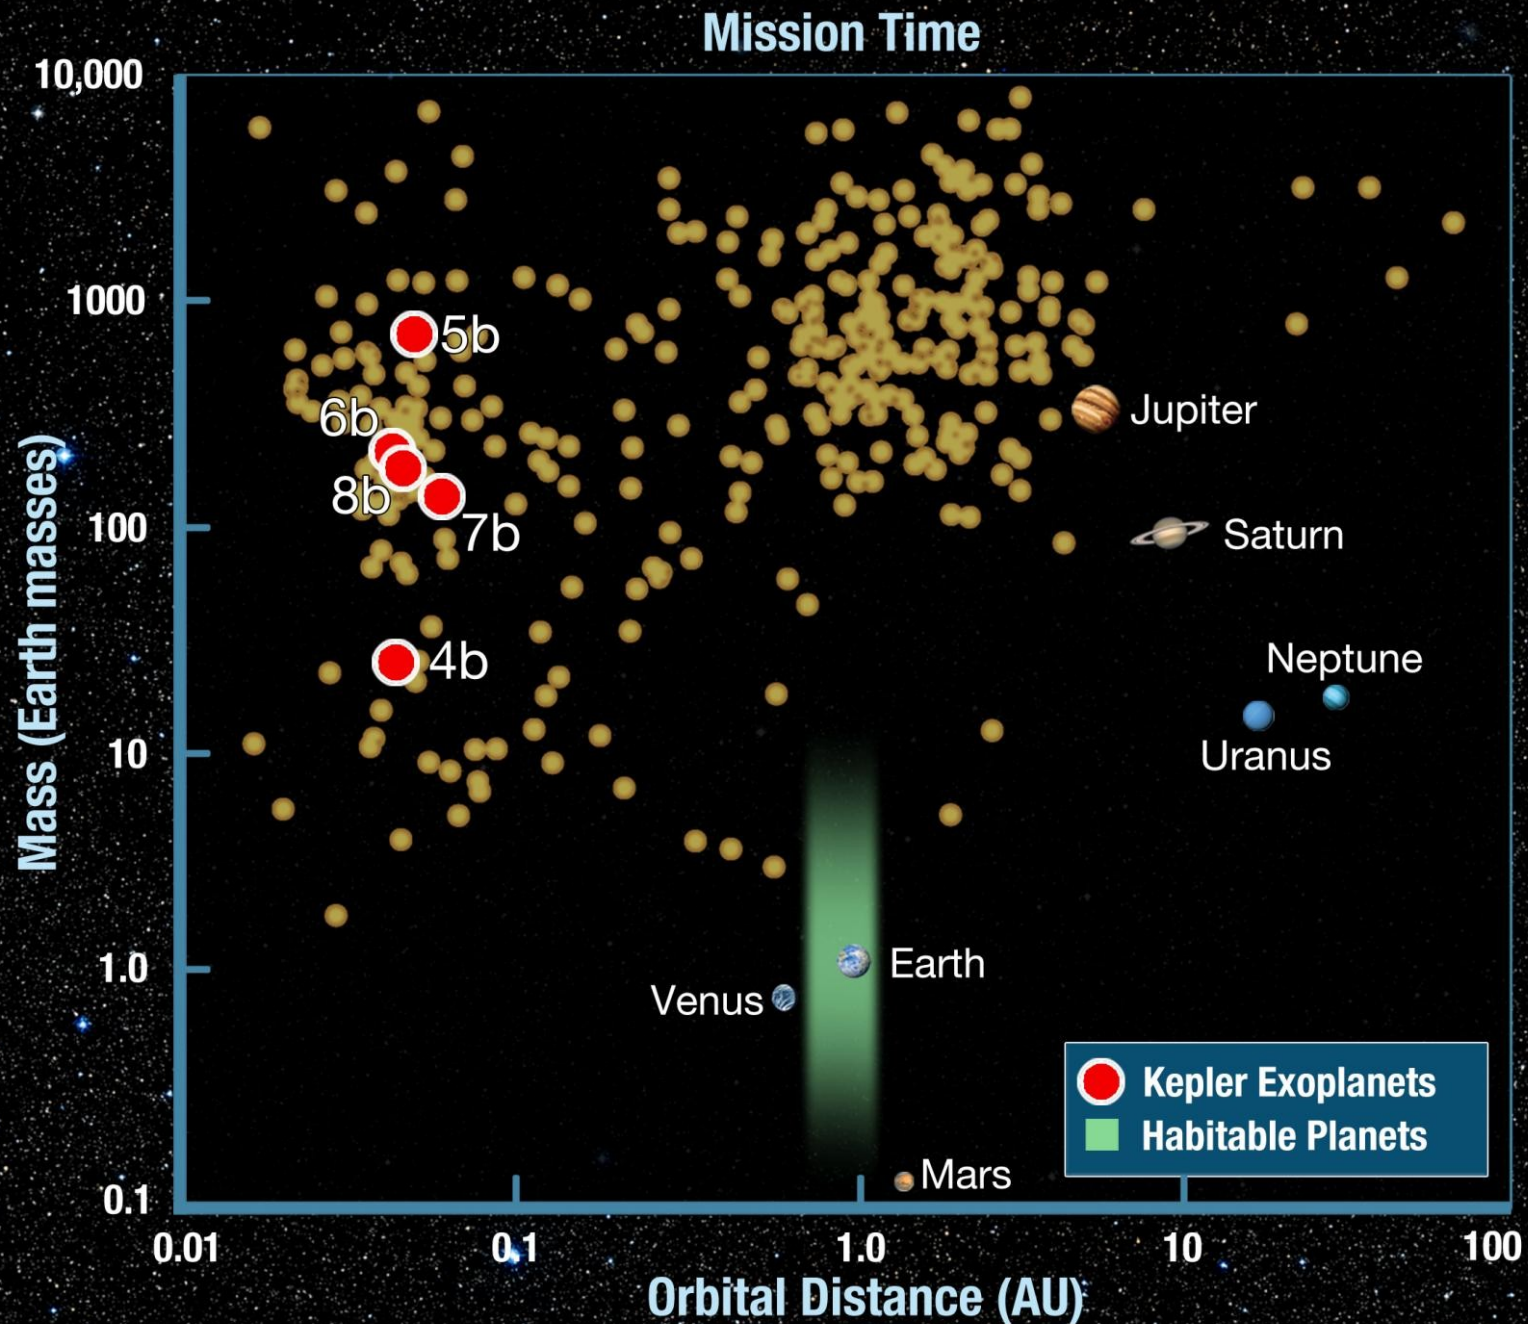

# Planet Size

# First Five Planet Discoveries

Made with First 43 Days of Data

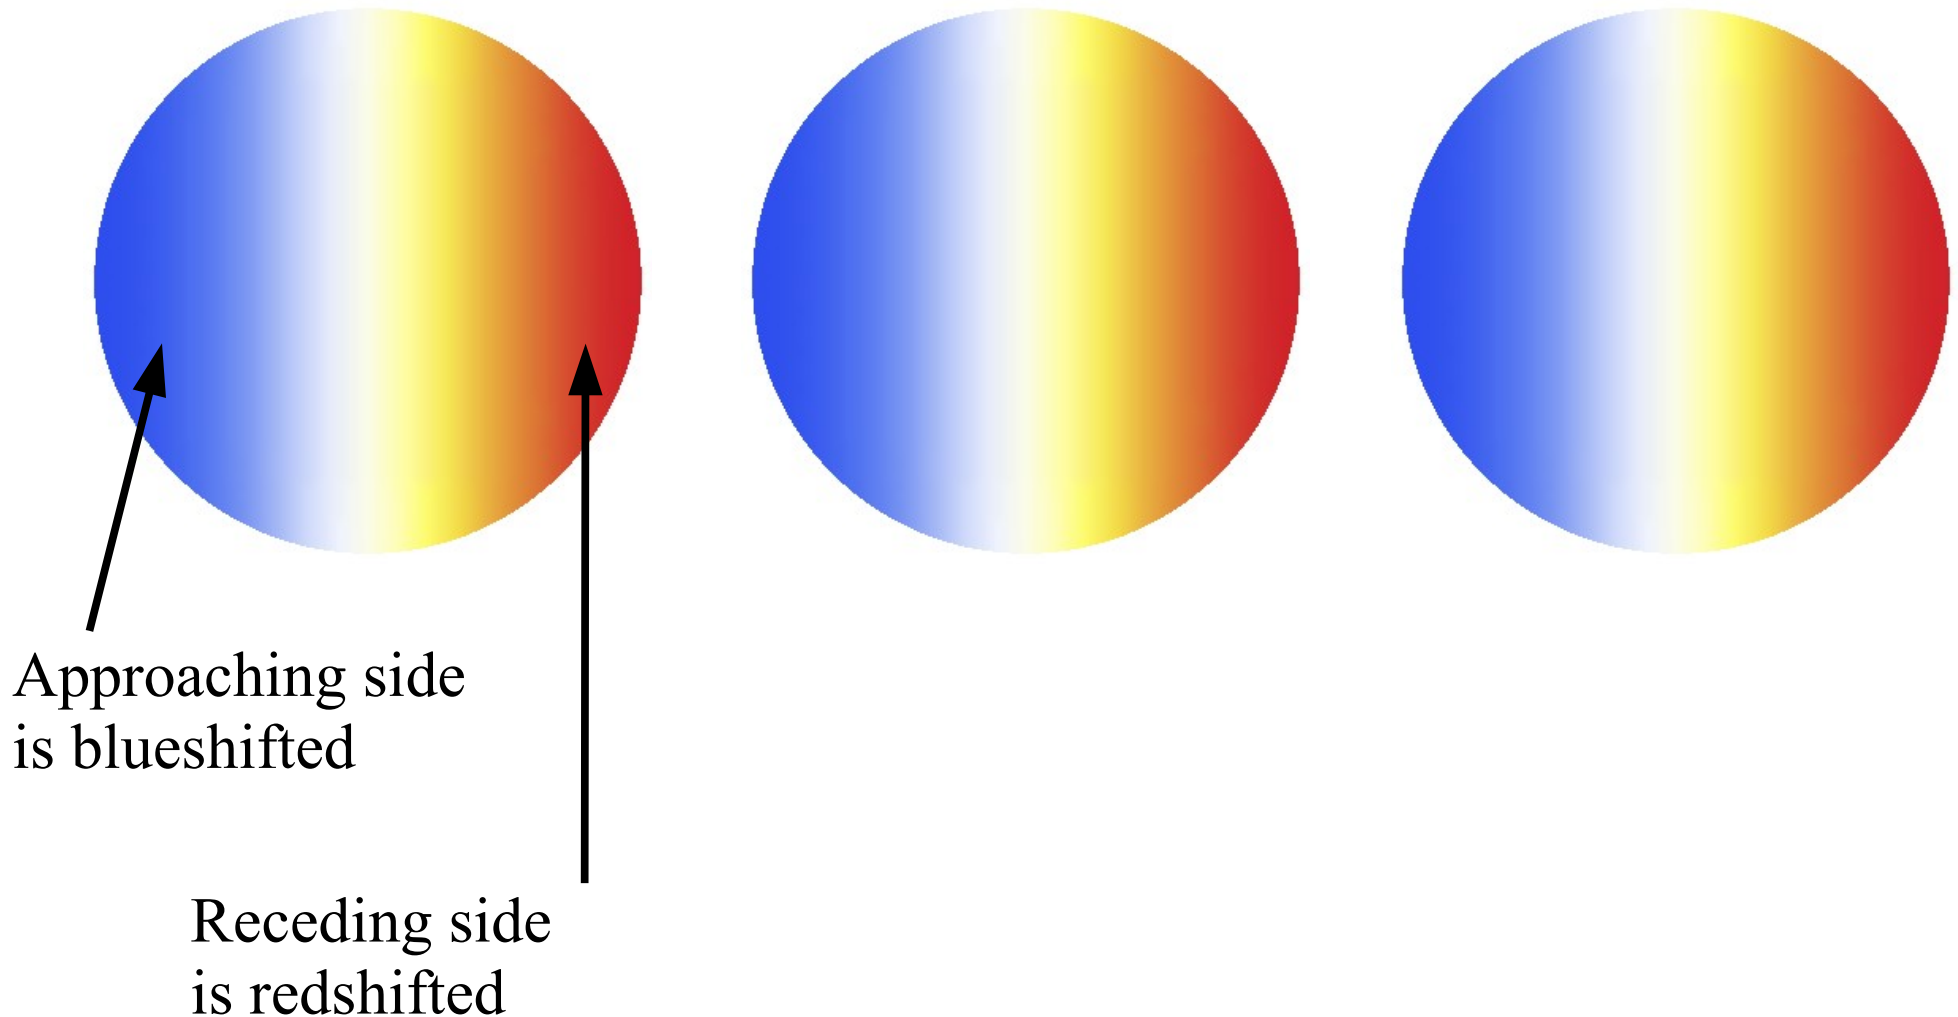

# Additional Science

- Planet formation, evolution, and dynamics
- Planet properties
- Stellar astrophysics, pulsation, and evolution
- Bug collecting

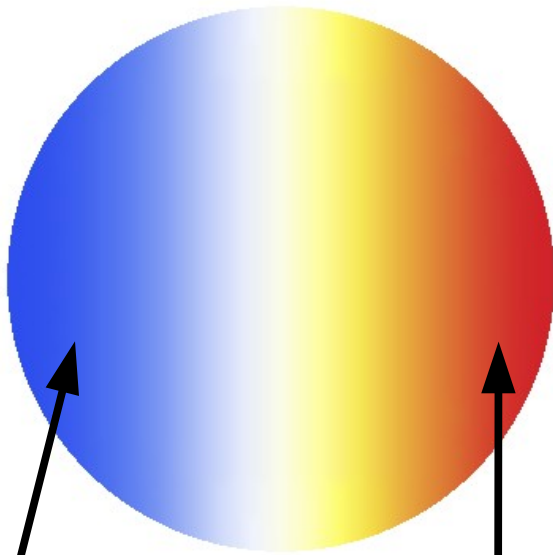

# Planet Formation and Dynamics

The Rossiter-McLaughlin effect for rotating stars

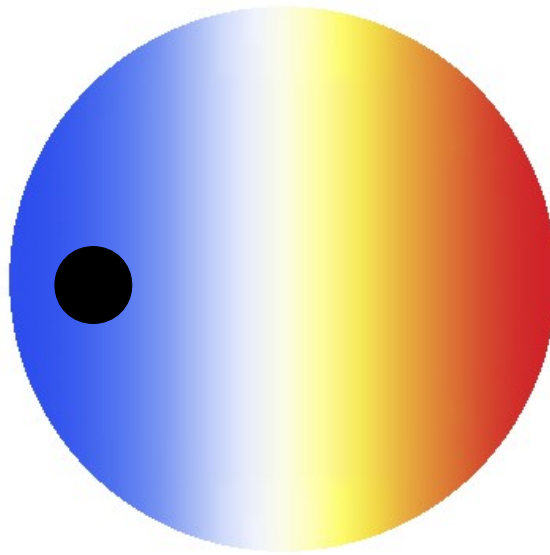

# Planet Formation and Dynamics

The Rossiter-McLaughlin effect for rotating stars

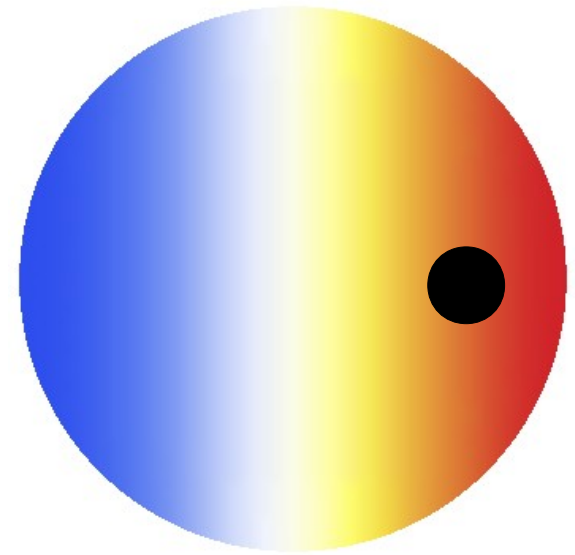

Approaching side  
is blueshifted

Receding side  
is redshifted

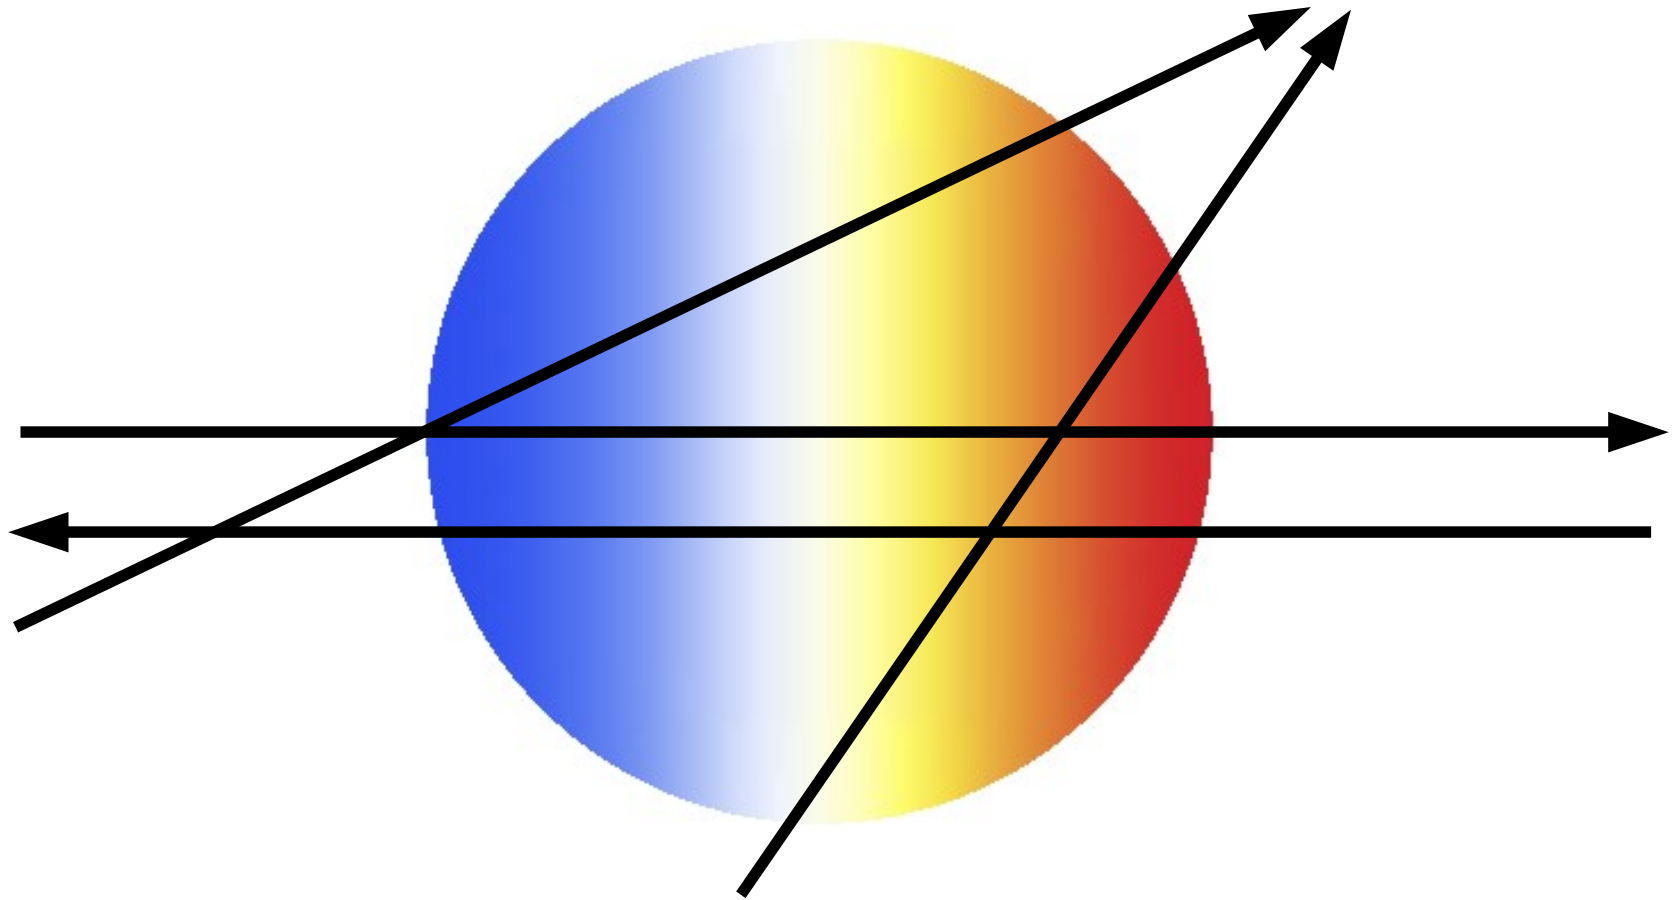

A planet on this side  
causes an apparent  
redshift.

A planet on this side  
causes an apparent  
blueshift.

# Planet Formation and Dynamics

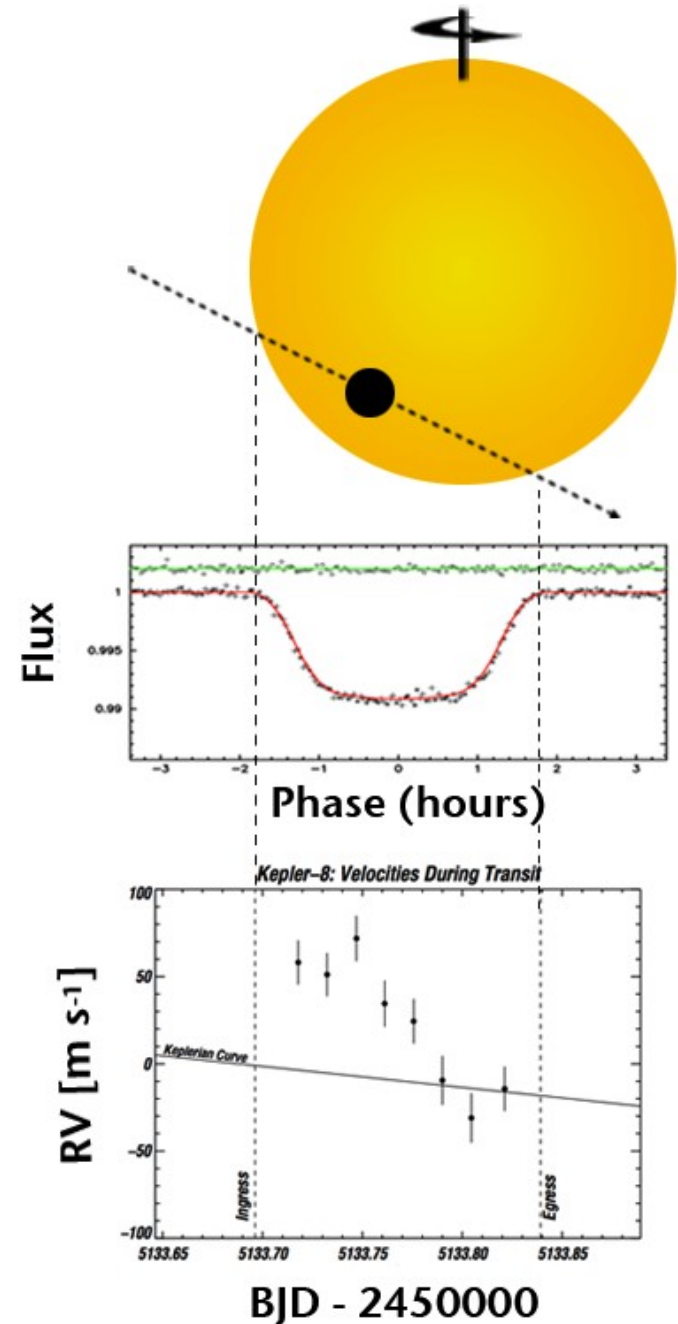

The Rossiter-McLaughlin effect for rotating stars

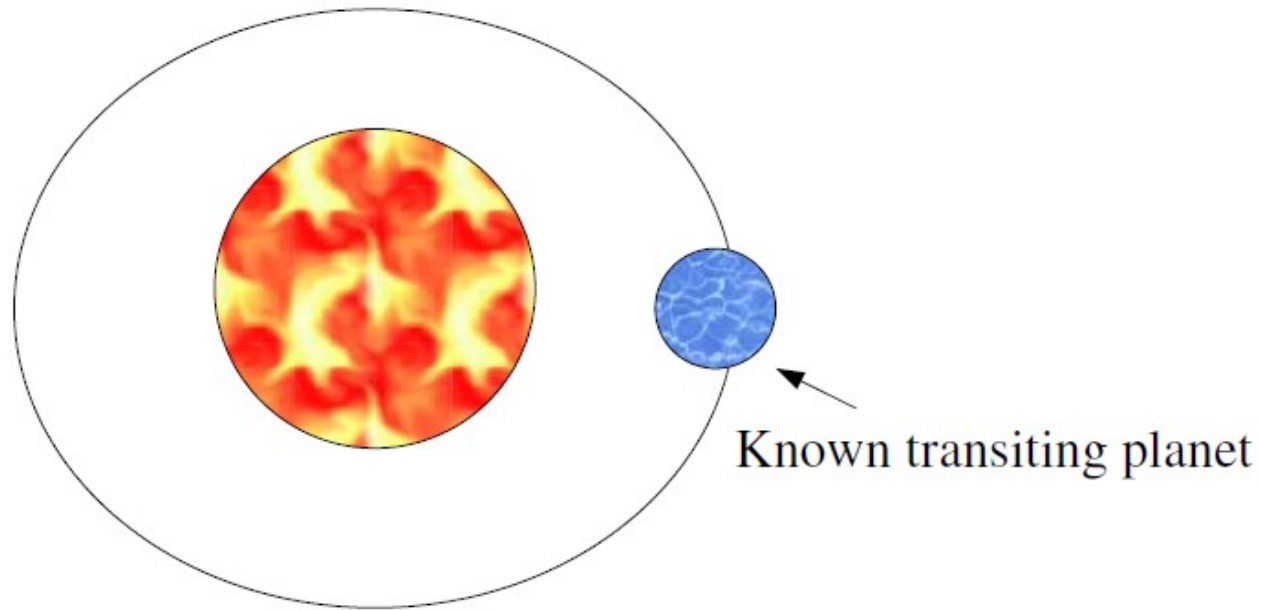

Transits along different trajectories give different signatures.

# Planet Formation and Dynamics

- Rossiter-McLaughlin effect measured on Kepler-8
- These measurements were used to confirm the planetary nature of the companion
- This system has a prograde orbit
- Note: the tip of the star towards the observer can be measured with asteroseismological analysis

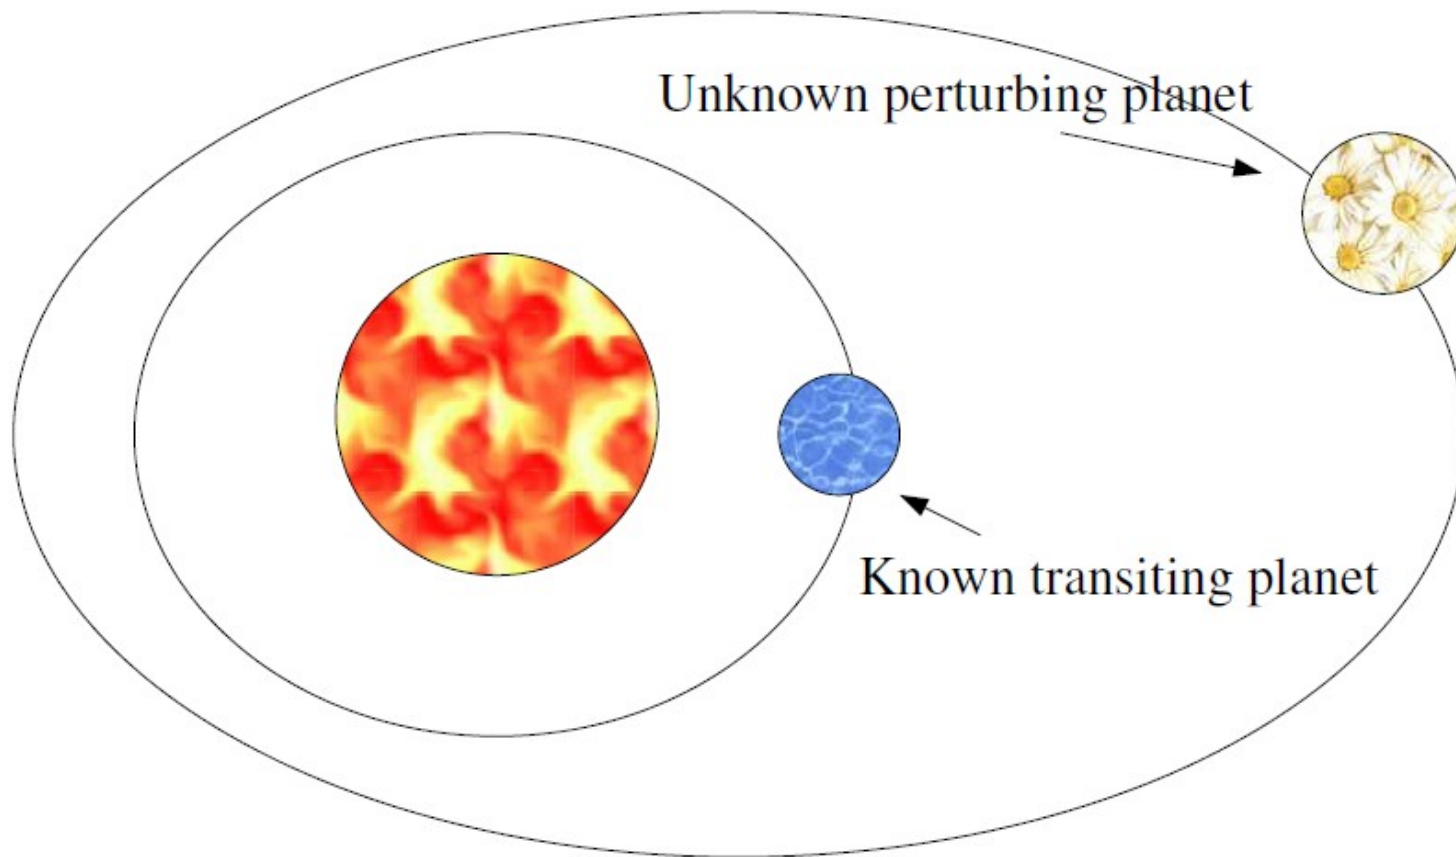

# Planet Formation and Dynamics

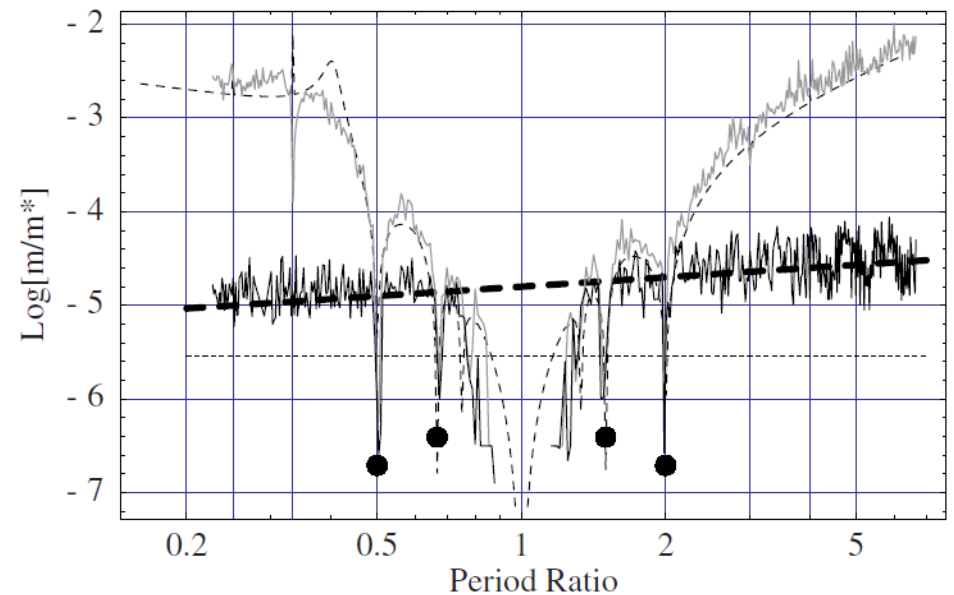

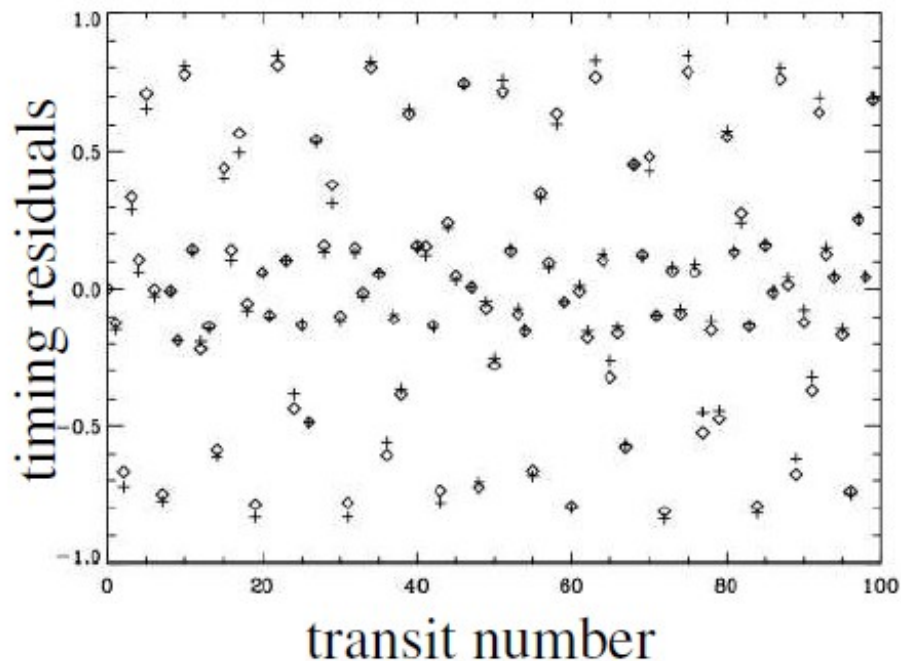

Transit times are equally spaced.

# Planet Formation and Dynamics

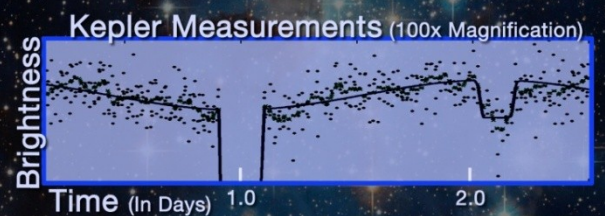

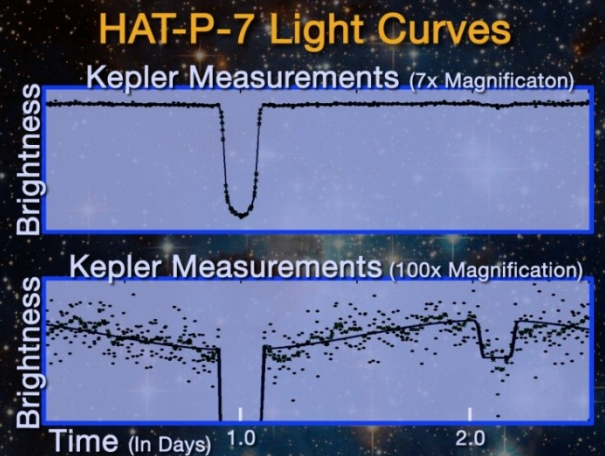

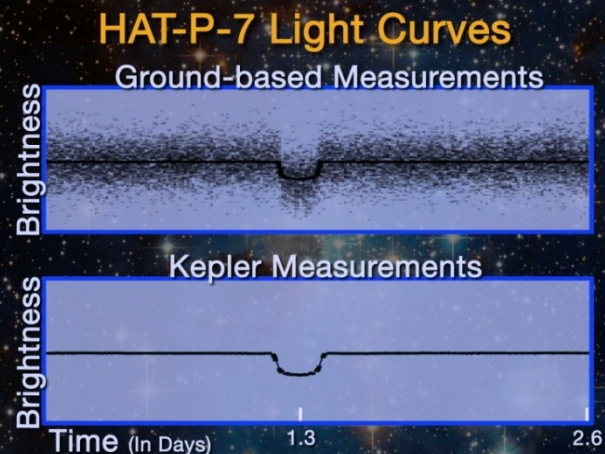

Transit times are NOT equally spaced.

# Planet Formation and Dynamics

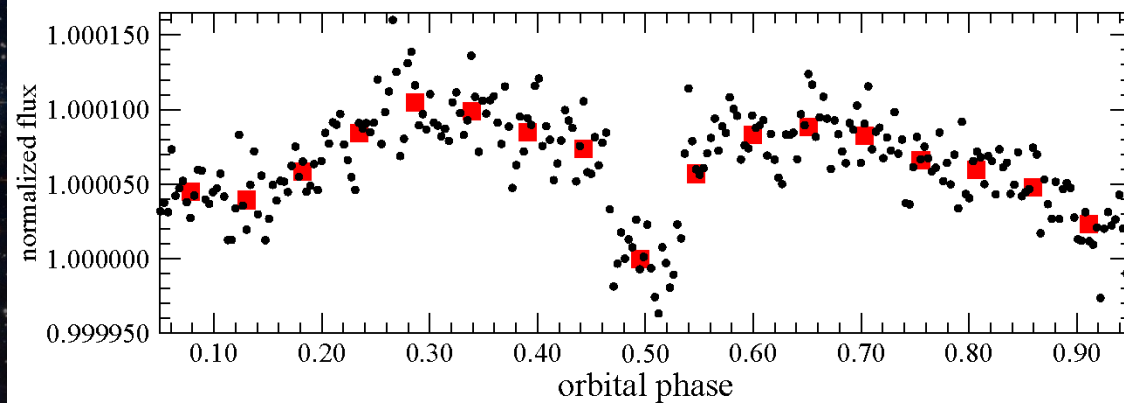

Transit timing variations (TTV) can be used to find additional planets, constrain planet formation models, and give complementary estimates of important system parameters (e.g. stellar mass).

# Planet – Star Interaction

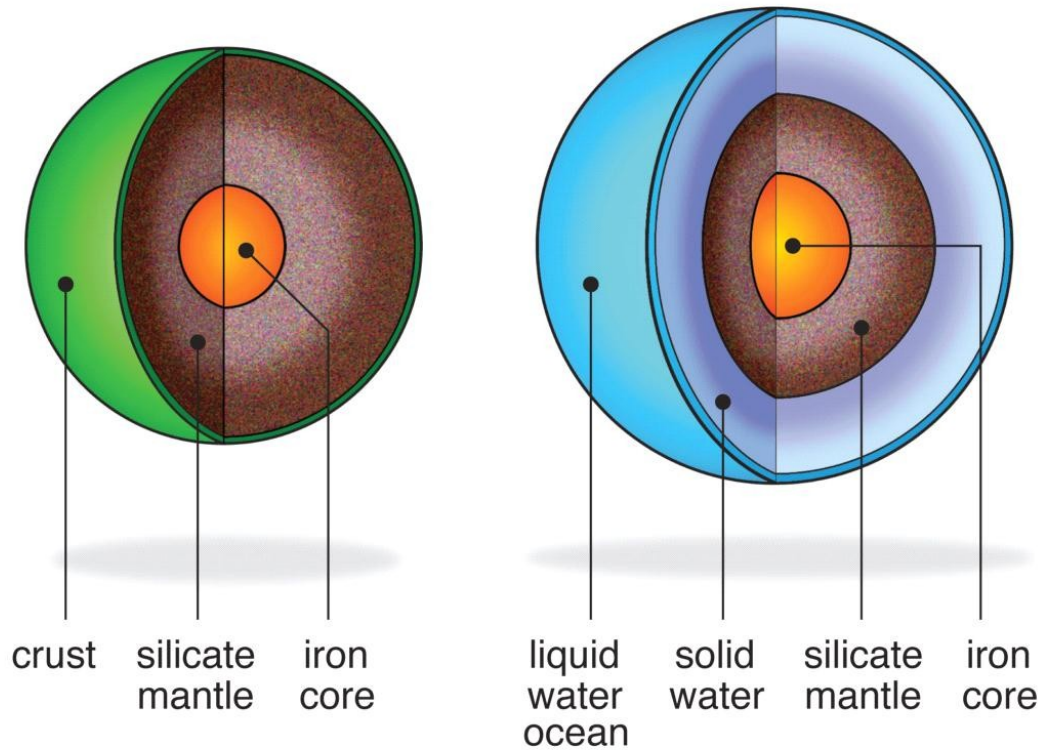

Detection of ellipsoidal variations in HAT-P-7.

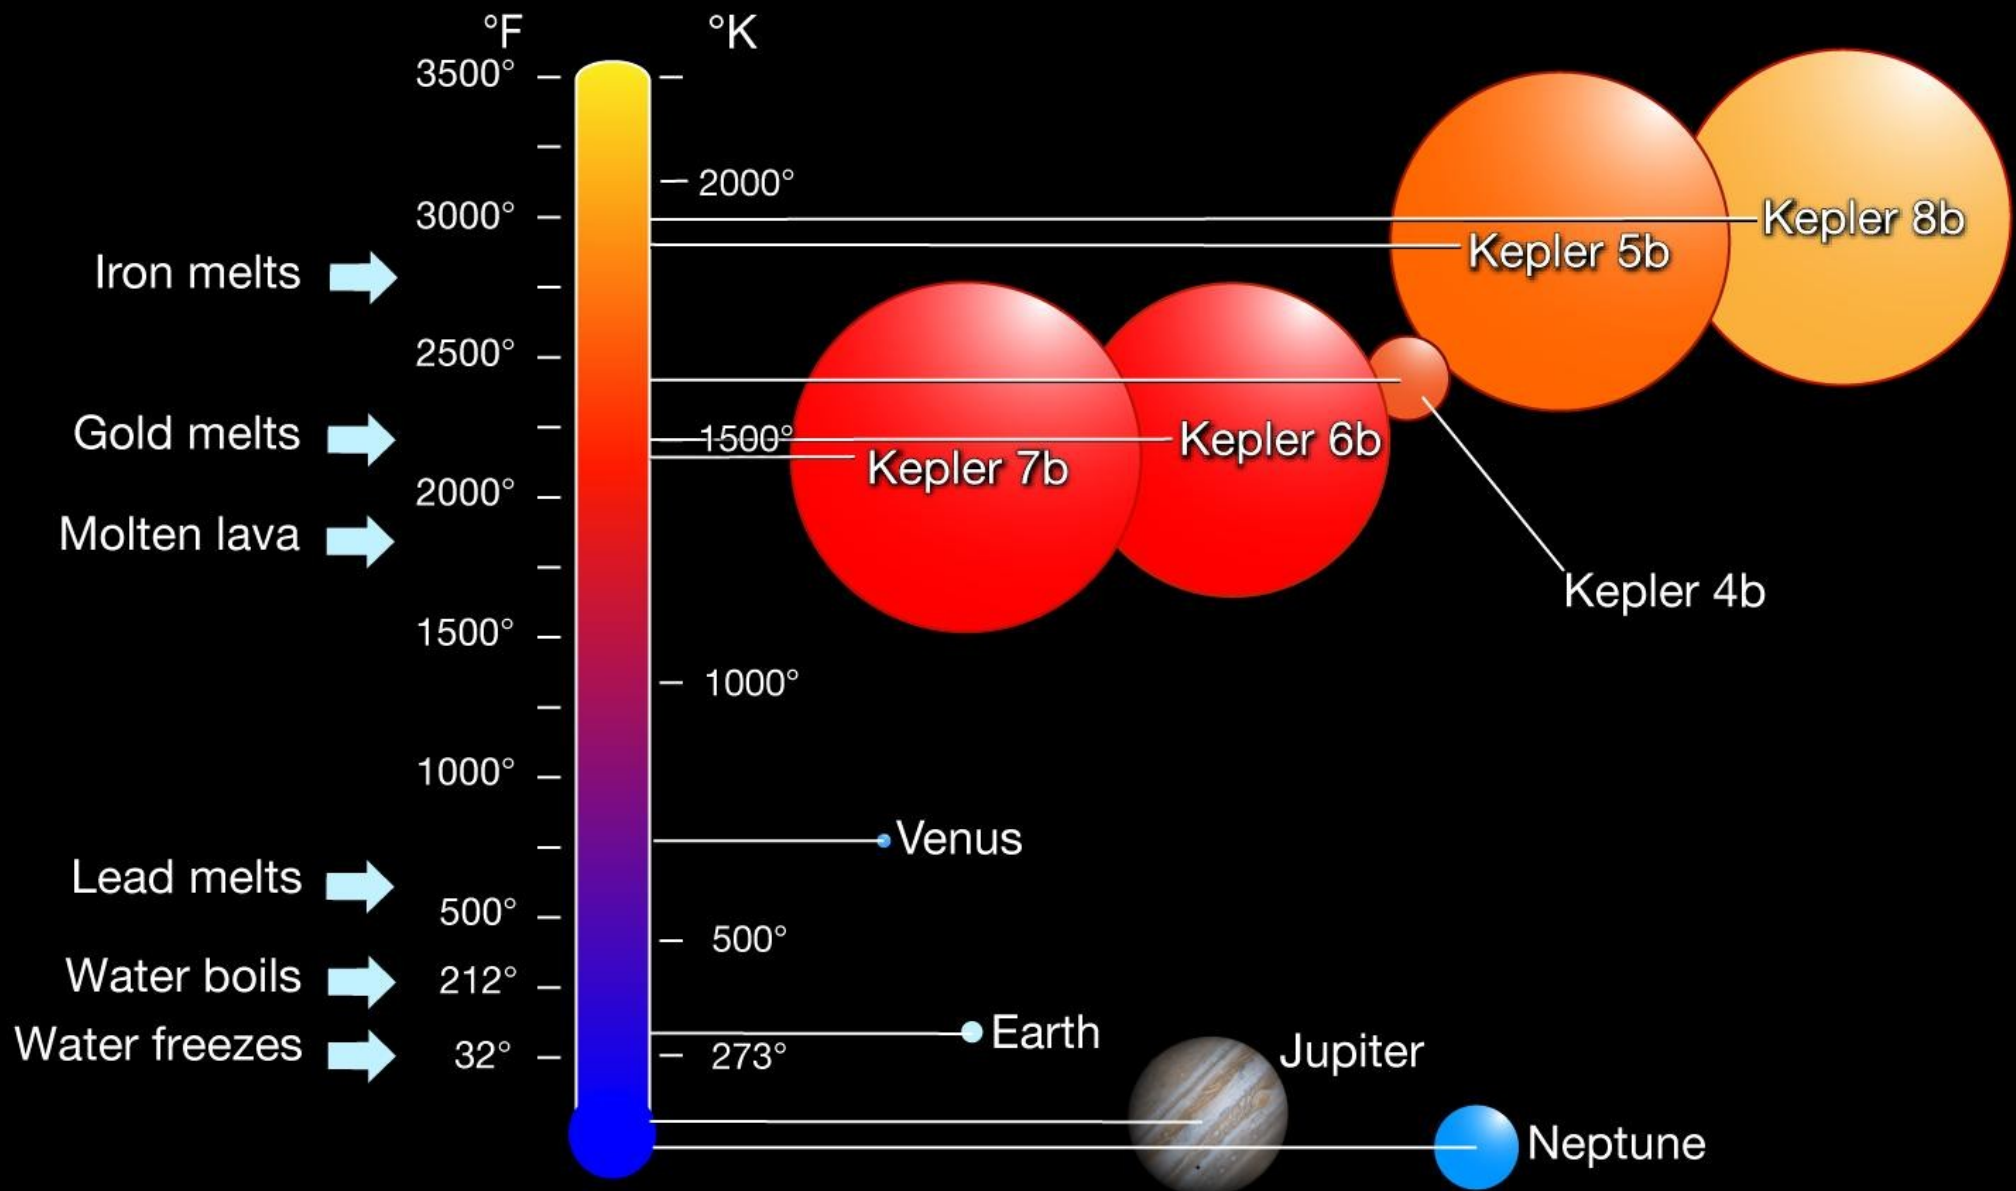

# Planetary Properties

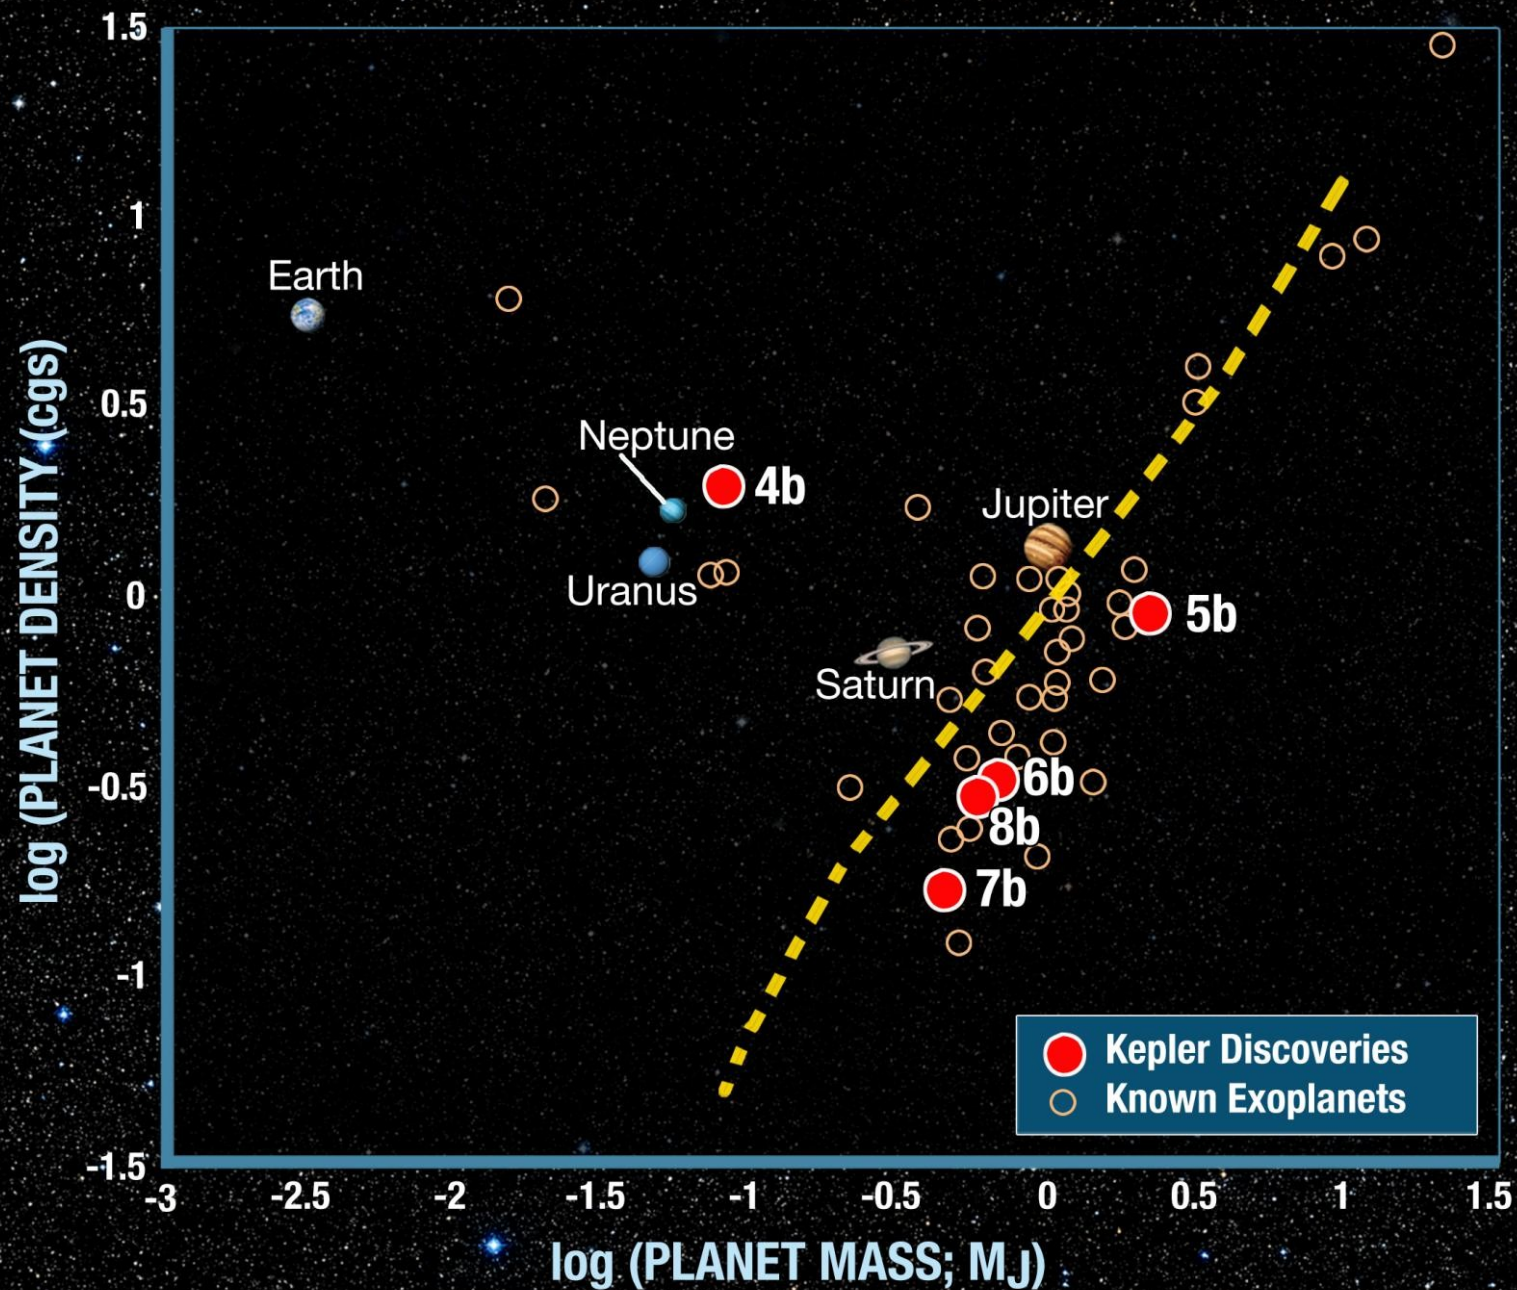

## Super-Earths

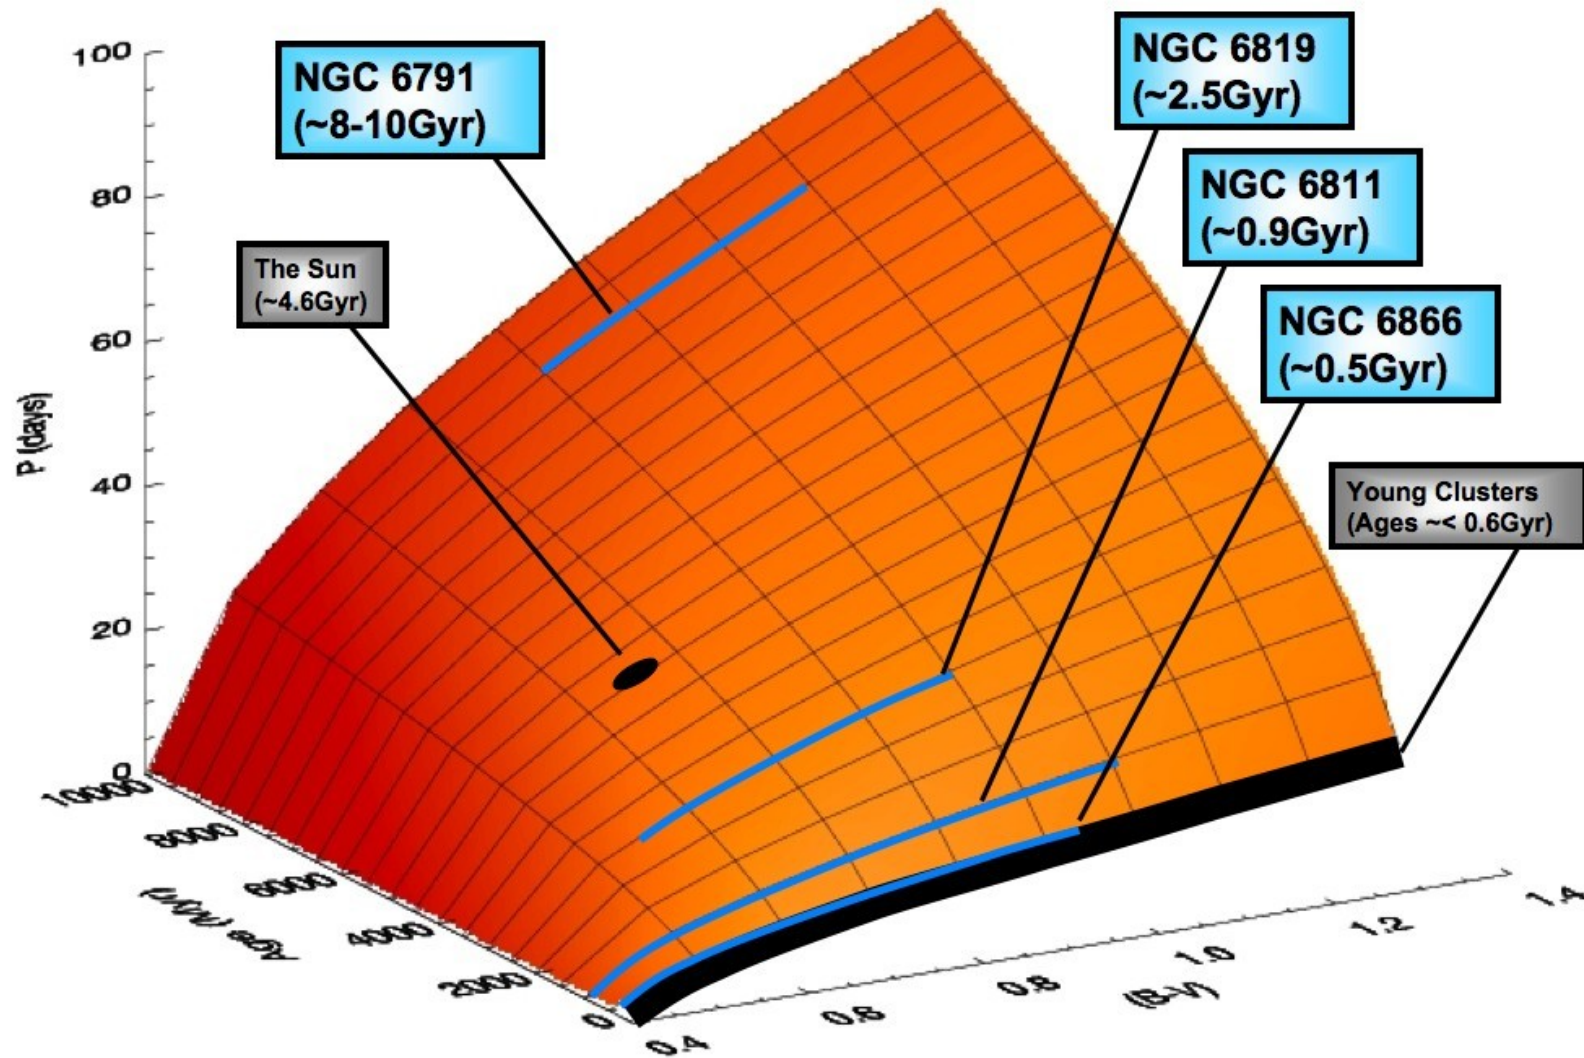

# Planet Temperature & Size

# Variation of Planet Density with Mass

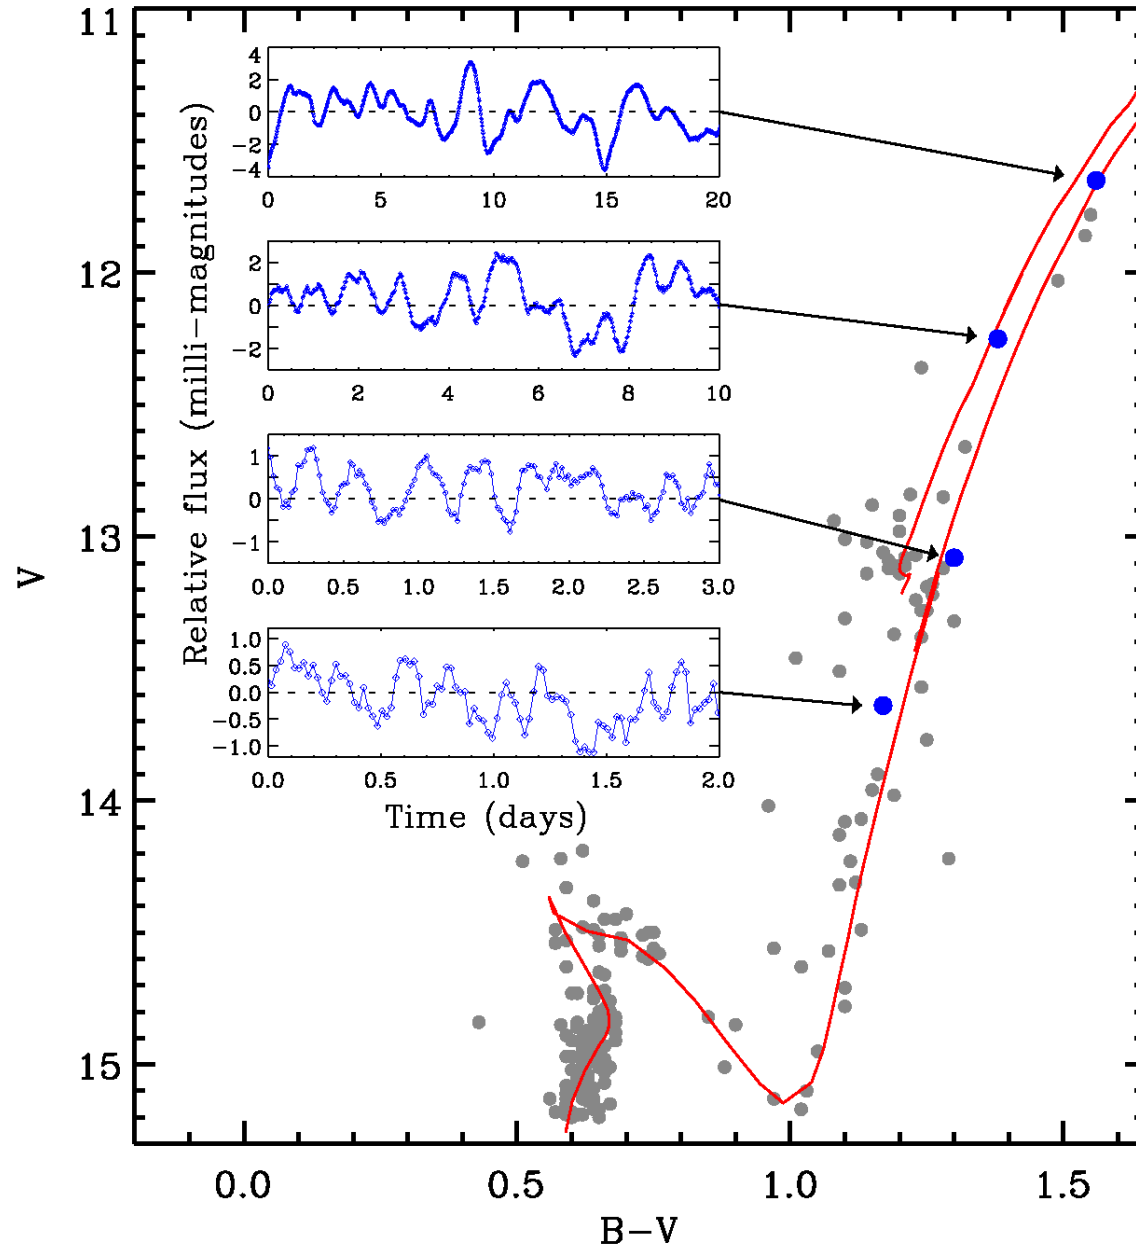

# Stellar Evolution with Kepler

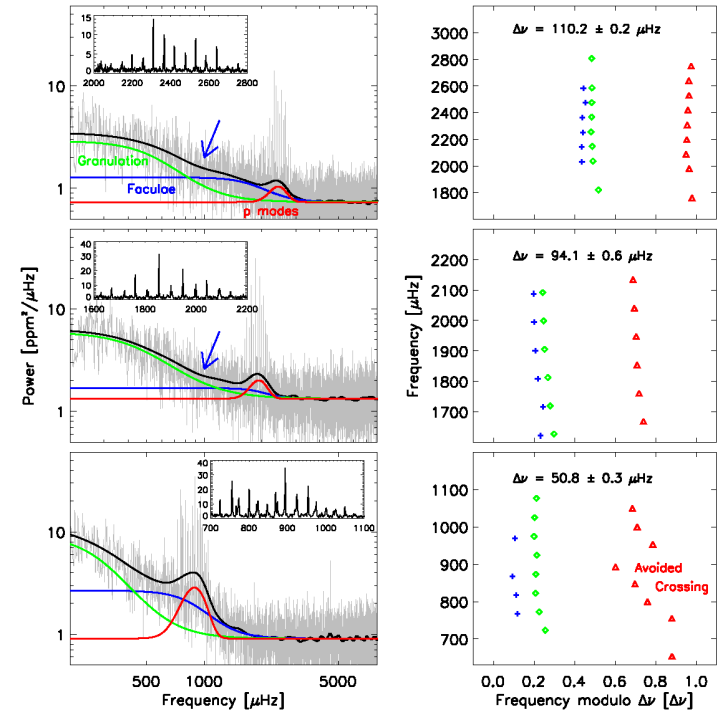

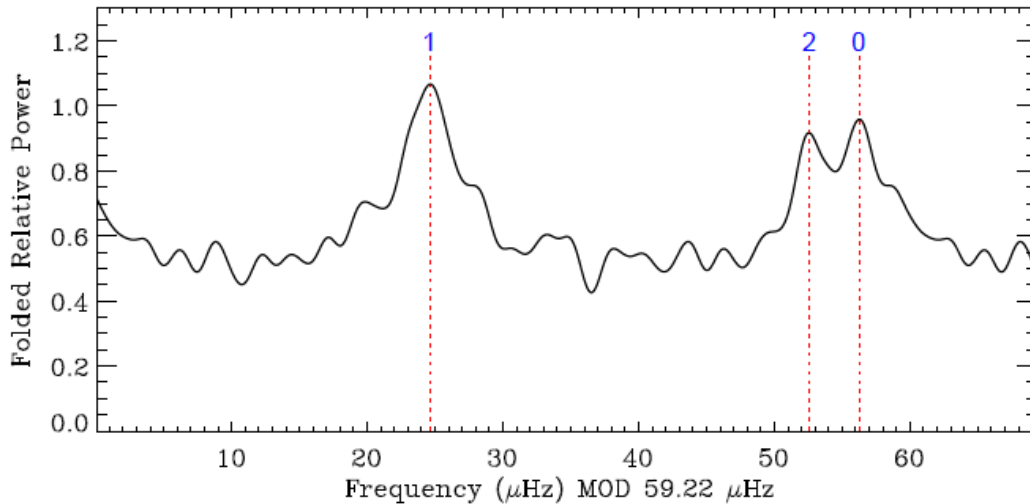

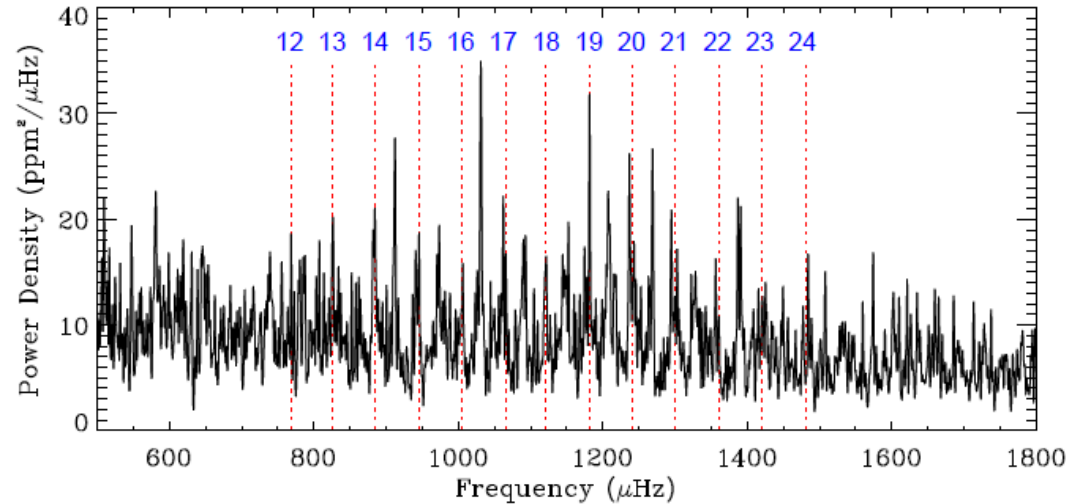

Rotation rates of stars in four open clusters in the Kepler field of view.

# Stellar Evolution with Kepler

Color-magnitude diagram for NGC 6819. The larger points are four of the *Kepler* targets. The timescale of the oscillations increases with stellar brightness.

# Stellar Oscillations

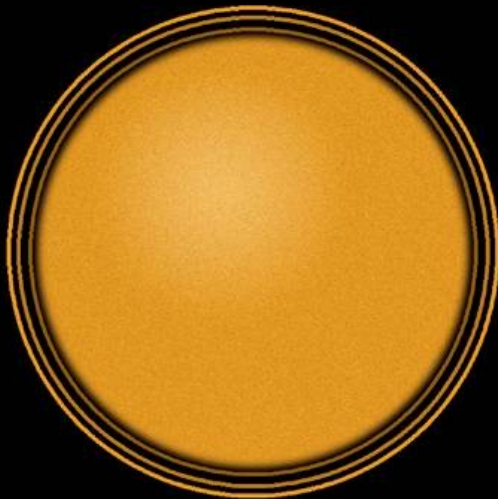

Left-hand panels:  
Frequency-power spectra  
of *Kepler* photometry of  
three solar-like  
stars (grey) over 200 –  
8000  $\mu\text{Hz}$ .

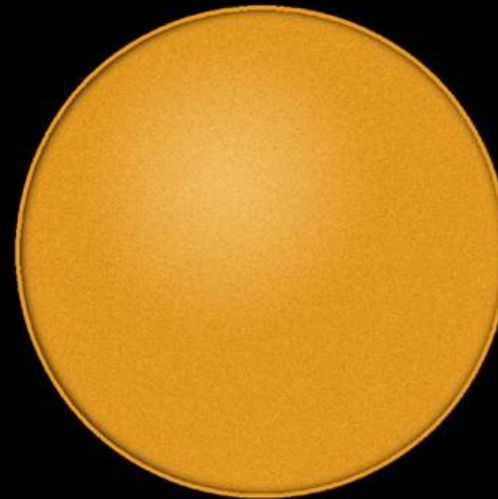

# Measuring Stellar Densities

## Kepler Determines Accurate Size for Exoplanet Host Star HAT-P-7

Diameter before Kepler  
known to  $\sim 10\%$

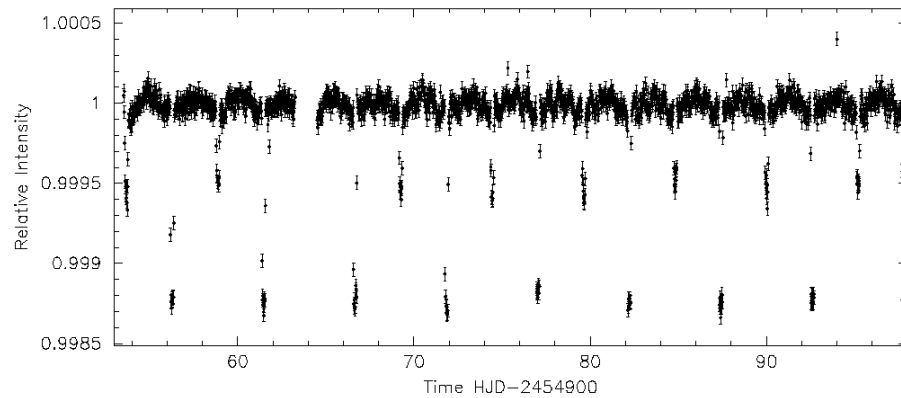

Diameter after Kepler  
known to  $\sim 1\%$

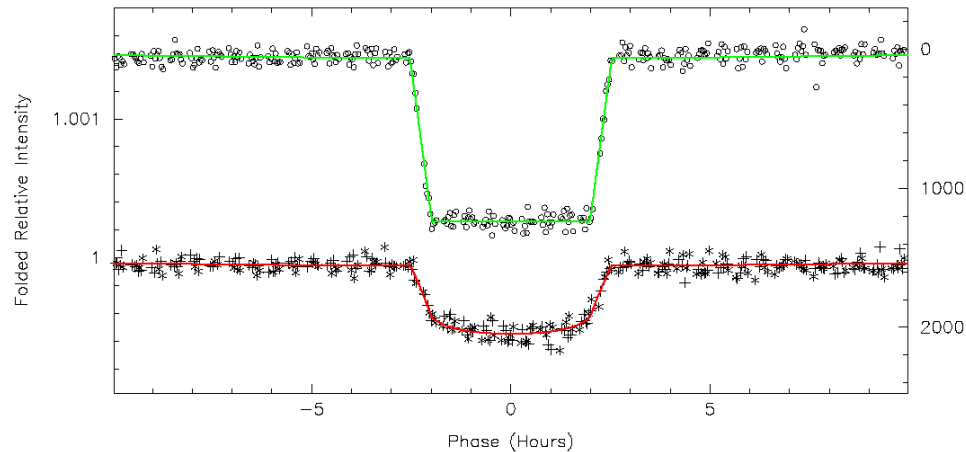

**Before- and after-Kepler knowledge of planet's  
density improves from  $\sim 50\%$  to  $\sim 5\%$  confidence**

# Strange Things

LIGHT CURVE

OCCULTATION: 1300 ppm

TRANSIT: 500ppm

Star temperature = 9400K

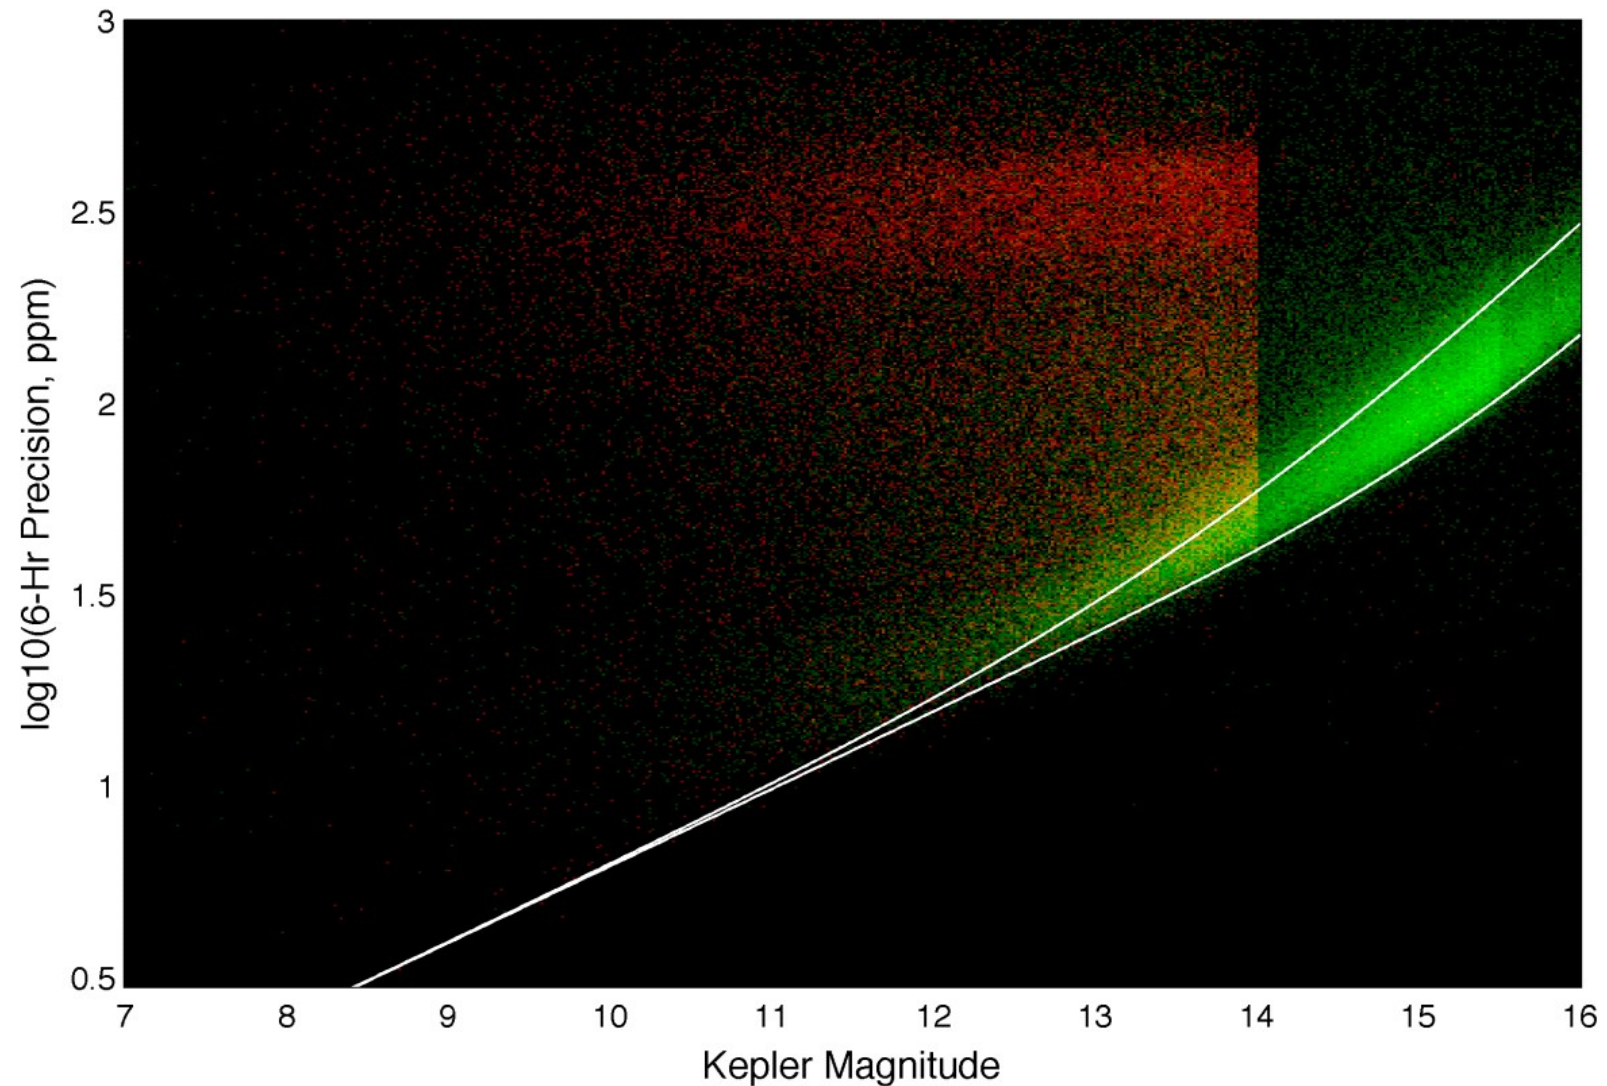

Companion temperature = 12,200K

Companion size =  $0.8 R_{\text{Jup}}$

# Concluding Remarks

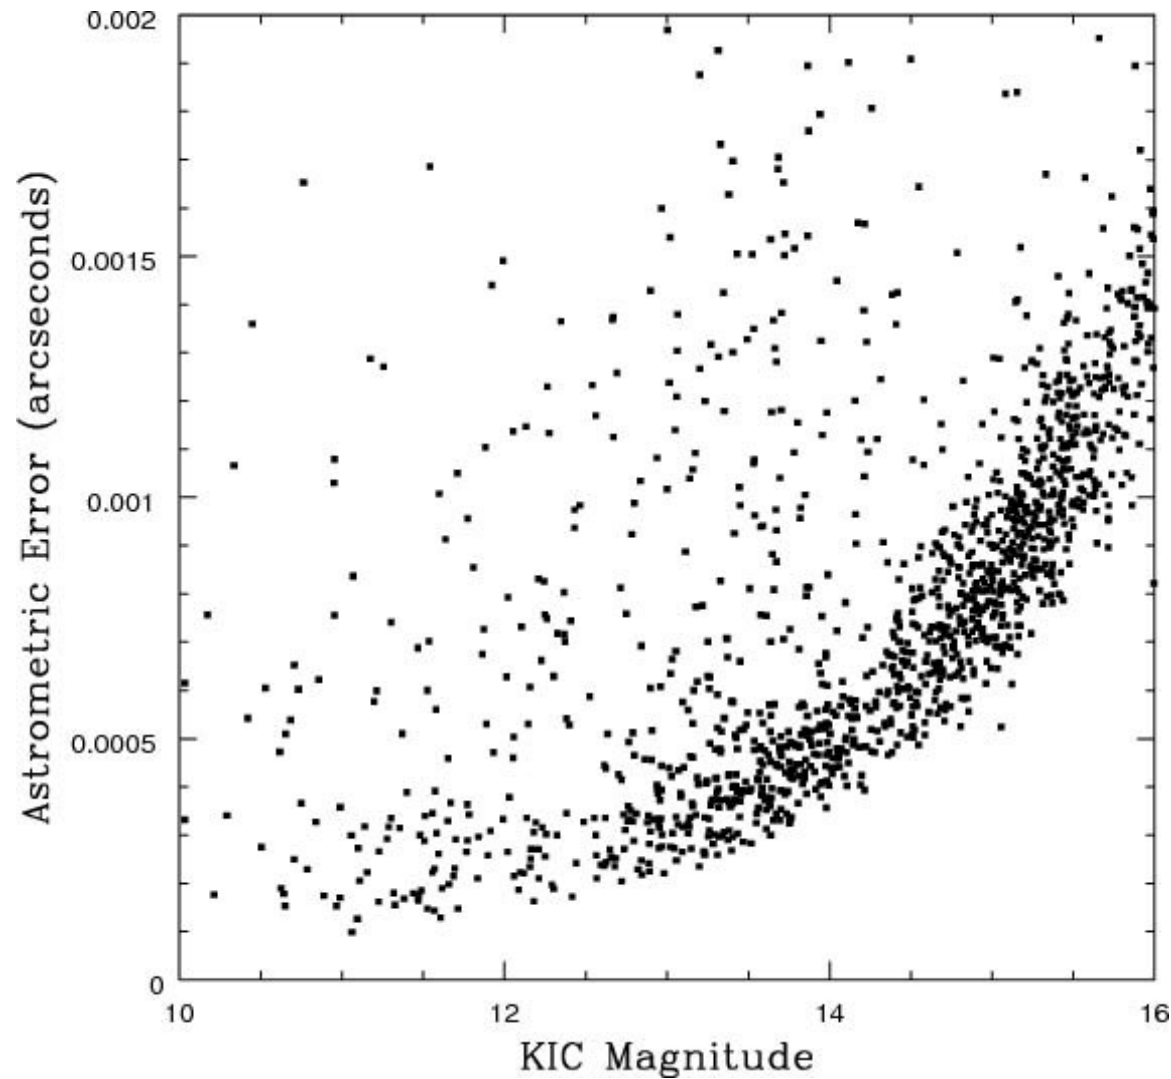

- Kepler is the first instrument capable of detecting a true Earth analog
- Kepler should answer many important questions about the population of planetary systems
- Kepler is the premier instrument for stellar variability studies
- Kepler is slated to run for 3.5 years with a possible extension to 7 – 10 years.
- A guest observer program is open to anyone to conduct non-planetary science.
- Results here are from 43 days of data, several months of data are currently available.

# Special Bonus Slides

Measured 6-hour precision of the Q0 data set. A strong separation in photometric variability can be seen between the dwarfs (green points) and the red giants (red points). The two curves bound the upper and lower measurement uncertainties propagated through the data processing pipeline.

# Special Bonus Slides

Astrometric error as a function of magnitude for stars on Channel 2 in the Quarter1 data collection.

# Special Bonus Slides
